## Trademarks

The following are trademarks or registered trademarks of their respective owners. Those listed as registered are registered in the United States Patent and Trademark Office. Some trademarks are also registered in other countries. Other product names mentioned in this manual may be trademarks or registered trademarks of their respective owners. QMS, the QMS logo, Crown, the Crown seal, PS Executive Series, imPRESS, and UltraScript/QMS, Inc. Adobe is a registered trademark of Adobe Systems Incorporated, registered in the United States Patent and Trademark Office. PostScript is a trademark of Adobe Systems Incorporated for a page description language and may be registered in certain jurisdictions. Throughout this manual, "PostScript Level 2" is used to refer to a set of capabilities defined by Adobe Systems for its PostScript Level 2 page description language. These capabilities, among others, are implemented in this product through a QMS-developed emulation that is compatible with Adobe's PostScript Level 2 language. Apple, AppleTalk, ImageWriter, LaserWriter, Macintosh, EtherTalk, and LocalTalk/Apple Computer, Inc. Centronics/Centronics Data Computer Corporation. Dataproducts/Dataproducts Corporation. DEC, DECnet, LN03, and VMS/Digital Equipment Corporation, PhoneNET®/Farallon Computing, Inc. FrameMaker/Frame Technology Corporation. CompuServe/H & R Block. Hewlett-Packard, HP, PCL, and HP-GL/Hewlett-Packard Co. IBM PC, AT, PC/XT, and Token-Ring/International Business Machines Corporation. ITC Avant Garde Gothic, ITC Bookman, ITC Garamond, ITC Zapf Chancery, and ITC Zapf Dingbats/International Typeface Corporation. Helvetica, Palatino, and Times/Linotype-Hell AG and/or its subsidiaries. Novell and NetWare/Novell, Inc. Tektronix/Tektronic, Incorporated. TOPS/Sun Microsystems, Inc. UNIX/UNIX Systems Laboratories, Inc. Ethernet and Xerox/Xerox Corporation.

## Proprietary Statement

The digitally encoded software included with the QMS 4525 Print System printer is Copyrighted © 1994 by QMS, Inc. All Rights Reserved. This software may not be reproduced, modified, displayed, transferred, or copied in any form or in any manner or on any media, in whole or in part, without the express written permission of QMS, Inc.

## Copyright Notice

# About This Manual

This manual provides information on how to operate and maintain your QMS 4525 Print System. Use the following summary, the table of contents, and the index to locate the information you need.

## Contents

### ■ **Chapter 1 — Introduction**

Introduces the QMS 4525 Print System, gives an overview of this manual, lists the manual's typographic conventions, and describes the QMS 4525 documentation.

### ■ **Chapter 2 — About the QMS 4525 Print System**

Describes the notable characteristics of the QMS 4525 Print System; explains how to control and configure the printer via the control panel and via local and remote consoles; discusses how the printer interacts with the application, PS Executive Series Utilities, and QMS Document Option Commands; and describes the QMS Crown multitasking operating system.

### ■ **Chapter 3 — Print Media**

Discusses print media, supported media sizes, and imageable areas. Provides information on paper, feeding paper, and paper tray configuration.

### ■ **Chapter 4 — Daily Operations**

Describes how to turn the printer on and off. Explains the dew prevention switch, describes how to load paper in the paper trays and how to refill the toner bin, and tells you how to use the 20- and 40-bin sorters and the stacker/stapler.

### ■ **Chapter 5 — Printing Your Files**

Describes how to print your files from applications, and with DOC, VMS, and UNIX commands; explains printer job spooling, feeding paper, selecting paper trays, selecting languages and emulations, printing duplex, printing multiple copies, collating, selecting orientation, using manual feed, printing multiple page images per

physical page (number-up printing), printing transparencies and labels, and printing header, trailer, and status pages.

■ **Chapter 6 — Troubleshooting**

Describes how to clear paper jams, explains what to do when the printer fails to print, and gives information on how to prevent paper jams. Lists control panel messages, and describes how to reset the printer and how to correct print quality problems.

■ **Appendix A — QMS Customer Support**

Provides world-wide product sales and support telephone numbers and describes how to communicate with QMS through the QMS Bulletin Board, CompuServe, the Internet, and Q-FAX.

■ **Appendix B — Technical Specifications**

Lists technical specifications of the printer.

■ **Appendix C — Character Encoding Tables**

Provides character location tables for the printer's typeface families.

■ **Appendix D — Manual Notices**

Provides important technical notices about the printer.

■ **Glossary**

Defines key terms.

■ **Index**

Provides assistance in locating specific items by alphabetically listing the major topics discussed in this manual.

## Typographic Conventions

The following typographic conventions are used throughout this manual:

Mixed-Case Courier	Text you type, and messages and information displayed on the console.
UPPERCASE or Mixed-Case Courier	Information displayed in the printer message window.
<i>Mixed-Case</i> <i>Italic</i> <i>Courier</i>	Variable text you type. Replace the italicized word(s) with information specific to your printer or computer.
<b>bold</b>	PostScript operators and CCITT, DOS, DOC, VMS and UNIX commands.
<i>lowercase italic</i>	Variable information in text and command variables.
UPPERCASE	File and utility names.
↵	Press the Enter key (PC) or Return key (Macintosh).

- » *Note:* Notes contain tips, extra information, or important information that deserves emphasis or reiteration.

---

 **Caution:** *Cautions present information that you need to know to avoid equipment damage or extreme annoyance.*

---

 **WARNING!** Warnings indicate the possibility of personal injury if a specific procedure is not performed exactly as described in the manual.

**ACHTUNG!** Bitte halten Sie sich exakt an die im Handbuch beschriebene Vorgehensweise, da sonst Verletzungsgefahr bestehen könnte.

---

# About the Documentation

This section describes the documentation that you received with your printer.

- ***QMS 4525 Print System User's Guide***

You're now looking at your detailed guide for information about the printer, how to load paper and refill the toner, how to print your files, and how to correct problems such as paper jams.

- ***QMS 4525 Print System Administrator's Guide***

Refer to this manual for information on printer installation, printer configuration via the control panel, printer-host communications, using disk drives, adjusting the laser beam intensity, job accounting, job recovery, and service.

- ***QMS Crown Remote Console User's Guide***

Refer to this manual for information on how to use a console to configure the printer. The QMS 4525 supports one local RS-232C console and up to eight remote consoles through Telnet or DECnet (using PS Executive Series Utilities for VMS).

- ***QMS Crown Technical Reference Manual***

Refer to this manual for information on the printer's page description languages and emulations, and on printer-host communications. In most cases, only advanced users and system administrators need this information.

» *Note: This manual is provided on disk in encapsulated PostScript (EPS) form. Refer to the README file for information on printing a hardcopy of the manual.*

- ***QMS Crown Document Option Commands***

Refer to this manual for information on QMS Document Option Commands (DOCs), which provide another way to control the printer. DOCs represent directives inserted usually at the beginning of documents to enable advanced printer features that cannot be accessed through your applications, page description

languages, or network print commands. In most cases, only advanced users and system administrators need this information.

■ ***QMS Crown Network Notes***

Refer to this manual for tips on using your QMS 4525 printer on a network connected via a serial or parallel interface. It discusses 3Com 3+Open, Banyan VINES, LAN Manager-based LANs, Novell NetWare, TCP/IP, UNIX, and VMS/DECnet. In most cases, only advanced network users and system administrators need this information.

- » *Note: This manual is provided on disk in encapsulated PostScript (EPS) form. Refer to the README file for information on printing a hardcopy of the manual.*

■ ***imPRESS Programming Manual***

Refer to this manual for detailed information on the QMS imPRESS programming language. Only users of the imPRESS language need this information.

- » *Note: This manual is provided on disk in encapsulated PostScript (EPS) form. Refer to the README file for information on printing a hardcopy of the manual.*

■ ***HP PCL 5 Emulation Technical Reference***

This manual provides HP PCL 5 emulation information for users experienced in working with both the PCL and HP-GL printer languages, commands, and concepts. It includes a list of printer-supported commands for the PCL 5 emulation to enable you to use the advanced features of your printer.

■ ***PS Executive Series Utilities***

Refer to the on-line help as you install and use the PS Executive Series Utilities host software that you received with the printer. Use the utilities as an easy way to configure the printer.

■ ***Printer Option Documentation***

If you purchased a printer option, such as a network interface, you should have received separate documentation for it.

# 2

---

## About the Printer

---

### In This Chapter . . .

- Printer features
- Controlling and configuring the printer
- QMS Document Option Commands
- Crown Multitasking

# Introduction

The QMS 4525 Print System offers a unique combination of 45 ppm printing speed, high-performance processing, extensive network/host connectivity options, innovative network features, and flexible paper handling features. Your printer can interface with most mainframes and minicomputers, plus any IBM PC or compatible and any Macintosh.

The printer comes in one of three configurations—20-bin sorter, 40-bin sorter, or stacker/stapler. The sorter units can be configured for individuals, work groups, departments, or print jobs. Each bin holds 100 sheets. The stacker/stapler unit staples up to 35 pages at once.

Here's how the QMS 4525 looks in each of its three configurations:

The QMS 4525 with a 20-Bin Sorter

The QMS 4525 with a 40-Bin Sorter

The QMS 4525 with a Stacker/ Stapler

# Printer Features

The following are the major features of your printer.

## PostScript Level 1 and Level 2 Compatibility

The QMS 4525 printer provides PostScript Level 1 and Level 2 page description capabilities via QMS-developed emulations that are compatible with Adobe's PostScript Level 1 and Level 2 languages while providing additional capabilities. PostScript controls the appearance of text, geometric shapes, and images at the printer. It can rotate, scale, clip, and orient graphic objects on all or part of a page. You can even print color PostScript files in black, white, and shades of gray to proof color files quickly and economically.

The PostScript Level 2 emulation supports the new capabilities of the "second generation" of Adobe's PostScript software. Level 2 consolidates extensions made to the PostScript language over the last few years and provides new features and functionality that expand the language's capabilities and improve overall performance. New PostScript level 2 features include improved memory and resource management, built-in data compression/decompression filters to speed up transmission times and save disk space, optimized graphics and text operators, and patterns and forms support, including pattern and form caching.

For additional information about the PostScript Level 2 emulation, refer to the *QMS Crown Technical Reference Manual*. For information about using specific Level 2 features, refer to your Level 2 application documentation.

## 13 Resident PostScript Typefaces

Your printer comes with 13 typeface families that contain 43 different PostScript fonts licensed from ITC and Linotype. All 13 typeface families have multilingual character sets and reside in memory. The fonts in all of these typeface families can be scaled, rotated, pattern filled, halftoned, shaded, shadowed, and cropped, depending on your application.

The PostScript typefaces that are resident on your QMS 4525 Print System are listed on the advanced status page. See chapter 5, "Printing Your Files," for information on choosing and printing the advanced status page.

- » *Note: The PostScript emulation also supports TrueType fonts.*

## Detailed Job Accounting

The QMS 4525 Print System provides job accounting which can be used to extract information such as paper utilization per user, time consumed servicing print jobs per user, usage of different emulations, connectivity options, frequency of jams, times of peak usage, features and options most commonly used (duplexing, finishing options), and number, complexity, and size of jobs per user. The list provided is not directly provided by accounting. Instead, such information can be extracted from the accounting file. The accounting is performed by the printer rather than a host, and the extracted information can be uploaded to any host by copying it to a floppy disk or by using the **ftp get** command (if your host supports this command). This information is useful for billing, report generation, and site resource planning.

## 6 Resident Emulations

### HP PCL 5 Emulation

The HP PCL 5 emulation also supports the Hewlett-Packard HP-GL/2 plotter language. You can print files encoded for the Hewlett-Packard LaserJet III, IIID, and IIISi printers as well as earlier LaserJet models.

This emulation supports the HP LaserJet III implementation (including resident and downloaded scalable typefaces, typeface rotations, all symbol sets, and integrated HP-GL/2 vector graphics) with the following restrictions.

- Resolution enhancement techniques are not supported.
- The hints contained in a downloaded scalable font are ignored.

- Envelope printing is not supported.
- Bitmap and scalable font cartridges are not supported per se. However, the QMS 4525 incorporates the typefaces supplied by the majority of HP bitmap font cartridges. Also Pseudo support for HP bitmap font cartridges is provided if font selection is specified through the HP PCL 5 font characteristic commands (as opposed to selecting the font by cartridge identifier). Also, differences between jobs printed on a LaserJet and jobs printed on a QMS 4525 may result if the job selects a font that is not present on the HP printer (with 0 to 2 cartridges loaded) but is available on the QMS 4525.
- Printer Job Language (PJM) is not supported.

#### ■ Resident PCL Fonts

The PCL 5 fonts that are resident on your QMS 4525 Print System are listed on the advanced status page. See chapter 5, “Printing Your Files,” for information on choosing and printing the advanced status page.

Three types of fonts are available for the printer in HP-GL/2 mode: scalable font, bitmap font, and stick point. (See the *HP PCL 5 Technical Reference* manual for more information on these fonts.)

- » Note: TrueType fonts are not supported by the PCL 5 emulation.

#### ■ PCL 5 Emulation Symbol Sets

The following PCL 5 emulation symbol sets are provided for the PCL 5 fonts:

DeskTop	ISO 85: Spanish
ECMA-94 Latin 1	ITC Zapf Dingbats 100
HP German	ITC Zapf Dingbats 200
ISO 2: International RV	Legal

ISO 4: United Kingdom	Math-8
ISO 6: ASCII	Microsoft Publishing
ISO 10: Swedish	PC-8
ISO 11: Swedish	PC-9 Danish/Norwegian
ISO 14: JASCII	PC-850
ISO 15: Italian	PiFont
ISO 16: Portuguese	PS Math
ISO 17: Spanish	PS Text
ISO 21: German	Roman-8
ISO 25: French	Ventura International
ISO 57: Chinese	Ventura ITC Zapf Dingbats
ISO 60: Danish/Norwegian	Ventura Math
ISO 61: Norwegian V2	Ventura US
ISO 69: French	Windows
ISO 84: Portuguese	

For information on selecting the PCL 5 emulation, refer to the *System Administrator's Guide*. For information about the emulation, refer to the *QMS HP PCL 5 Emulation Technical Reference manual*.

■ imPRESS Page Description Language

The QMS 4525 fully supports the imPRESS page description language, including the following features:

- 
- Full support for portrait, landscape, inverse portrait, and inverse landscape printing orientations
  - The ability to place a character anywhere on the page, in pixel increments, in any orthogonal orientation
  - Compact representation of bitmap fonts
  - Character, word, and line advance typesetting application control
  - Flexibility in font selection and use
  - Resident fonts available in all four orientations
  - Support for downloaded bitmapped fonts
  - Graphics support for polygons, arcs, and textures
  - Bitmap image printing with limited magnification capability (2X, 4X)
  - Up to 256 substitution macros per document
  - Capability to define and print within a rectangular clipping region
  - Forms support for up to 255 forms per document
- 

## Lineprinter Emulation

The Lineprinter emulation prints simple byte-oriented line printer files. A byte-oriented line printer handles jobs consisting of a series of bytes where lines are delimited by carriage return and line feed characters as opposed to a mainframe record-oriented line printer where each record begins with a printer carriage control character. Refer to the *QMS Crown Technical Reference Manual* for additional information about Lineprinter emulation.

## CCITT Groups 3 and 4 Emulation

This emulation provides high-speed printing of CCITT Groups 3 and 4 compressed bitmaps only. See the *QMS Crown Technical Reference Manual* for a complete explanation of this emulation and its commands.

■ Supported CCITT Commands

The following CCITT groups 3 and 4 commands are supported on your printer:

Reverse bits	%%BitReverse
Set end of block	%%BlockEnd
Set data compression	%%Compression
Set dpi	%%DPI
Set encoded byte flag	%%EBA
Start decompression	%%ImageData
Set image position	%%ImagePosition
Set image size	%%ImageSize
Invert image	%%InvertImage
End print job	%%JobEnd
Set line end	%%LineEnd
Eject page	%%PageEnd
Set rotation	%%Rotation

### HP-GL Emulation

Your printer provides HP-GL plotter emulation (7550A, 7470A, 7475A, and ColorPro).

### LN03 Plus Emulation

The LN03 Plus emulation offers all of the features of an LN03 Plus laser printer, including DECTEK emulation, Digital's Tektronix 4014 emulation.

## Software Loadable System Upgrades

Software upgrades for your QMS 4525 Print System are user installable. This makes it easier for you to keep up with the latest software changes, and you can reload the system software onto the printer's hard disk.

## QMS Crown Technology

QMS Crown is a proprietary multitasking printer operating system, which allows QMS to adapt advanced printer software to the evolving printing needs of users in many different environments. Crown includes features such as simultaneous interface operation (SIO), emulation sensing processor (ESP) technology, input buffers, compile-ahead processing, compressed data formats, automatic jam recovery, user-configurable memory clients, context switching, and spool overflow.

## RISC-Based Controller

The QMS 4525 Print System delivers 45 simplex pages per minute (ppm) of 300 dots per inch (dpi) letter/A4 output using an R3000 RISC-based processor.

## 32 MB of Resident RAM

Your printer comes standard with 32 MB of resident RAM (Random Access Memory). Large data-intensive files can be spooled to the printer, freeing the host for other tasks.

## Flexible Paper Handling Capabilities

The QMS 4525 provides automatic feeding of paper in the following sizes:

Letter	Commercial
Legal Large	Foolscap
A4	Folio
Quarto	Legal Small

Your printer comes standard with upper and lower paper input bins. The upper bin has a capacity of 600 sheets of 20 lb (15 g/m<sup>2</sup>) or 400 sheets of 32 lb (120 g/m<sup>2</sup>) paper. The lower bin has a capacity of 1600 sheets of 20 lb (75 g/m<sup>2</sup>) paper. Paper is automatically fed from these two input bins. You may also manually feed paper, transparencies, labels, and other types of media.

The side output bin and each sorter bin holds a maximum of 100 sheets of 60 to 100 g/m<sup>2</sup> paper, or a maximum of 50 sheets of 100 to 120 g/m<sup>2</sup> paper. Output options include a 20-bin face-down sorter with a total capacity of 2000 sheets, a 40-bin face-down sorter with a total capacity of 4000 sheets, or a stacker/stapler with total capacity of 2200 sheets (500 in upper bin, 1700 in stacker bin).

Your printer also supports advanced document processing, paper handling, and finishing options such as duplex and tumble duplex printing, booklet printing, multiple page images per physical page (n-up printing), and both first-sheet-first and last-sheet-first printing, sorting, stapling, offset stacking, and dynamic paper supply switching.

## Internal Hard Disk Support

Your printer comes standard with an internal 344 MB hard disk and a 1.44 MB floppy disk drive (MS-DOS compatible).

## Disk Caching

Your printer provides a high-speed 180 KB temporary buffer for information going to and from the hard disk, such as fonts or logos that may need to be referenced frequently. The cache speeds the printer by retrieving the information from the cache instead of access the hard disk each time the information is needed. Also information that is being written to the hard disk can be held in the cache temporarily until a more convenient time to write it to the disk.

## Convenient User Interface

Your printer provides convenient multilingual status reporting, job queue management, file system management, and printer configuration through the printer control panel, PS Executive Series Utilities, and optional local and remote console sessions.

## Printer Options

The following options are available for your printer:

## ■ External Hard Disks

The printer's 50-pin SCSI 1-2 connector allows you to expand your printer's capabilities with the addition of up to six external 344 MB SCSI hard disks to store downloaded fonts and optional emulations. Refer to the *System Administrator's Guide* for more information.

## ■ Dual I/O Slots

The QMS 4525 Print System has dual I/O slots to support two different network interfaces such as Token-Ring, Ethernet, and IBM 3270A and 5250 for Coax and Twinax.

### —Network Interfaces

In addition to the three standard interfaces—the QMS 4525 Print System has the option of using additional network interfaces, such as DECnet, DECnet and TCP/IP (dual stack), Novell NetWare, and TCP/IP for Ethernet; Novell NetWare and TCP/IP for Token-Ring; and IBM 3270A and 5250 for Coax and Twinax. (See your QMS vendor for a list of available protocols.)

Also, a kit is available which converts the standard Centronics parallel interface into a Dataproducts parallel interface.

**User Benefit**—Network interfaces provide flexibility and fast data transfer in complex network environments. Simultaneous Interface Operation (SIO) allows all protocols to run concurrently. The printer is ideal for networks. It also meets the needs of dissimilar networks and host environments by connecting directly to varied interfaces, eliminating the need for print servers.

## ■ Output Options

The printer offers three types of output and finishing devices: A 20-bin sorter, a 40-bin sorter, and a stapler/stacker. Refer to the *System Administrator's Guide* for more information.

■ **Consoles**

Remote consoles (Telnet and DECnet) and a dedicated local console (RS-232C serial) provide job status and font information to any user who has the capability to send and cancel print jobs. The system administrator uses the consoles for printer configuration and file system management. Refer to the *QMS Crown Remote Console Manual* for more information.

■ **Host Software**

Host Software permits easy integration into UNIX host environments.

## Controlling and Configuring the Printer

There are three ways to configure and control the printer:

- Control panel
- Local and remote consoles
- PS Executive Series Utilities

### Convenient Control Panel Operation

The printer control panel allows you to configure the printer to your specific printing needs. The printer also uses the control panel to communicate with you by providing messages about its status, including any conditions that require your attention. These messages can be displayed in English, French, or German. The following is a brief introduction to the control panel.

When the printer is on line and idle (ready to accept a print job), this is what the control panel looks like.

### Control Panel Keys

These are the keys that are functional when the printer is on line:

Symbol	Key Name	Function
	Continue	Continues the current print job after a paper jam or engine error is cleared.
	Status Page	Prints a status page which shows the printer's current status and configuration, including available paper sizes and installed fonts.

Controlling and  
Configuring the  
Printer

 <p>•Off •On</p> <p>line</p>	Line	Toggles the printer between on line and off line. The two lights above the key indicate the current status.
 <p>Clear</p> <p>Cancel</p>	Cancel	Cancels all jobs that are currently being processed or printed, or sends an end-of-job indicator to a print job waiting for incoming data. Print jobs that are spooled begin printing after current jobs are cancelled or ended.

When the printer is off line, these keys are functional:

Symbol	Key Name	Function
<p style="text-align: center;">enter</p>  <p style="text-align: center;">Continue</p>	<p>Enter</p>	<p>Works as an Enter key when selecting configuration options or when you are entering data in the configuration menus. If a menu displays, pressing this key enters that menu.</p>
<p style="text-align: center;">Clear</p>  <p style="text-align: center;">Cancel</p>	<p>Clear</p>	<p>Clears input data from the display at the current cursor position.</p>
<p style="text-align: center;">back</p>  <p style="text-align: center;">1</p>	<p>Back</p>	<p>Enters the Configuration menu. In other menus, this key goes back to the previous menu.</p>
<p style="text-align: center;">previous</p>  <p style="text-align: center;">2</p>	<p>Previous</p>	<p>Moves to the previous option in the current menu. When you are entering data, this key also cycles to the previous ordinal character.</p>

Symbol	Key Name	Function
next 	Next	Moves to the next option in the current menu. When you are entering data, this key also cycles forward to the next ordinal character.
	Left	Moves the cursor left one character position. Use this key and the Right key when entering a string in response to a configuration question.
	Right	Moves the cursor right one character position. Use this key and the Left key when entering a string in response to a configuration question.
A..Z 	A..Z	Cycles through the characters A to Z when you are entering data.

Symbol	Key Name	Function
<p>A/a</p> 	A/a	Toggles between uppercase and lowercase letters.
<p>0..9,..</p> 	0..9,..	Cycles through numeric values 0 - 9, followed by punctuation keys and symbols (for example, !, @, #, \$), when you are entering data.
<p>multi value</p> 	Multi Value	Intended to be used only by the QMS Service Engineer and is not described in this manual.
<p>●Off ●On</p> 	Line	Exits from the Configuration menu and toggles the printer between off line and on line.

## Changing Configuration Settings

Once the printer is off line, you can enter the Configuration menu by pressing the Back key. The Configuration menu displays as two fields of text. The first field is the current menu, and the second field is the current item in the current menu. Here's how the control panel display looks at this point.

To select an item in the current menu, use the Next and Previous keys to display the item you want in the second field and press the Enter key. If the selected item is another menu, the menu name and the first item in the menu display. If the selected item is a configuration option, the option displays in the first field and the first item of a list of possible options displays in the second field. If the option requires you to input text (printer name, for instance), the current text is displayed in the second field with the first character underlined. Use the A..Z key to cycle through the alphabet, and the Left and Right keys to move between characters in the text.

- » Note: The following characters appear as blocks on the remote console when you enter or change data. These block-represented characters are not supported on the QMS 4525 Print System.

Use the previous and next characters to determine what specific character is being represented by the blocks.

Block-represented Character	Previous Character	Next Character
space	z	0
\$	#	%
^	]	-
-	^	,
~	}	A

Refer to the *System Administrator's Guide* for detailed information on controlling and configuring the printer via the control panel.

## Local and Remote Consoles

The QMS 4525 Print System allows you to connect a local console directly to an RS-232C console port on the printer, and multiple remote consoles via TCP/IP Telnet. Remote consoles behave similarly to the local console (and control panel) as far as the information displayed and available console commands are concerned.

Status conditions that require user intervention display on the local console and any remote consoles. For example, status messages may indicate that paper is low, output bins are full, or a paper jam has occurred. Status messages display each time the user presses the Enter key on the console keyboard. When the problem is fixed,

Printer Ready

displays.

The console is a simple, line-oriented display of 24 lines of 80 characters. To list the available console commands, type ?↵ on the console

keyboard. If executing a console command results in more than a single screen of output, the display pauses every 24 lines and waits for you to press any key to continue.

## Console Modes

System users and the system administrator use the console for different purposes. System users use the console to check the status of their print jobs, cancel print jobs, check available fonts, check the printer configuration, or print a file from the printer's hard disk. The system administrator uses the console more extensively for printer configuration and file system management.

Thus, the console operates in two different modes, *user* and *admin*. In the default user mode, only a subset of the console commands is available. Only one console session may be in admin mode at a time. The console prompt indicates if the console is in admin mode, user mode, or if the system is off line.

Refer to the *Crown Remote Console User's Guide* for complete information on using local and remote consoles to control and configure the printer.

## PS Executive Series Utilities

PS Executive Series Utilities, included with and designed specifically for your printer, provide another means of communicating with your printer. It supports PC and Macintosh environments. Although the functionality of the PS Executive Series varies according to the operating environment, it generally serves as an easy-to-use software tool for setting up the printer.

Features provided only through the PS Executive Series Utilities include the following:

- Printer drivers, including a Windows 3.x driver
- Screen fonts for Macintosh users
- Screen printing for PC users
- Printer naming

The PS Executive Series Utilities on-line documentation gives complete instructions for installing and using the software.

## QMS Document Option Commands

Your QMS 4525 printer offers a wide range of capabilities for designing and printing documents. However, applications and printer emulations (PostScript and HP PCL, for example) differ in their ability to access some of these document printing capabilities. The QMS Document Option Commands (DOC) provide a way to access printer features that cannot be accessed by your application or your printer emulation. See the *System Administrator's Guide* and the *QMS Crown Document Option Commands* manual for more information.

- » Note: Updated Information on DOC commands that has not yet been included in other manuals is included in appendix E, "Manual Updates," of the *System Administrator's Guide*. These commands are prefixed with an "\*" .

### Command Summary

The following is a list of QMS Document Option Commands.

#### Header/Trailer

<b>Function</b>	<b>Command</b>
Print document creator	%%Creator:

*Start New Layout	%%IncludeFeature: newlayout

## Crown Multitasking

The QMS 4525 features the QMS Crown multitasking printer operating system. The following sections describe this architecture and the advanced features it provides.

Most printers are single-task oriented: they must finish printing one page in a document before they can begin processing the next page or an entirely new print job. QMS Crown architecture, on the other hand, employs a multitasking scheme that allows the printer to accept and process subsequent pages or new print jobs while the printer is printing another page or document.

A typical printer converts transmitted print data into a raster image, one page at a time, using the appropriate printer language. This raster image is stored in the printer's memory as a bitmap image until the printer controller sends the bitmapped image to the print engine for printing. Due to memory restrictions, a limited number of bitmap images may be stored in RAM simultaneously. A page must be printed, and memory released, before the printer can begin to rasterize a new page. The result is relatively slow print performance while the host waits for the printer to accept new print data.

Using its Crown multitasking capability, the QMS 4525 performs these activities simultaneously rather than sequentially. This is accomplished using advanced memory management techniques such as simultaneous interfacing, input buffering, job spooling, compile-ahead technology, compressed data formats, error recovery, user-configurable memory clients, context switching, and spooling overflow.

Multitasking and advanced memory management increase the productive use of resources by minimizing idle time. More time is spent processing jobs rather than waiting for jobs to print.

## Compile-Ahead Technology

Pioneered by QMS, compile-ahead technology significantly reduces processing time by increasing controller throughput, more fully utilizes the resources of the printer, offloads print processing tasks from the host CPU, and speeds up the network by quickly transferring jobs from the host into input buffers for processing at the earliest possible time. This technology also provides the capability for advanced paper handling features, such as multipage job collation, automatic error recovery, and input/output bin selection on a page-by-page basis.

QMS compile-ahead technology is a considerable improvement over the traditional rasterization process used by most other printers. The traditional rasterization process involves the transformation of text and graphics into a bitmap image that is then printed. Rasterization is necessary because applications use page description languages such as PostScript to describe the text and graphics that make up each page. The printer translates these instructions into a format it can understand before printing a page. This is usually a very time-consuming process.

### *The Traditional Rasterization Process*

Rather than rasterizing the page as a whole, the Crown operating system compiles the page into an intermediate, compressed QMS display list. If the printer is busy printing, the intermediate blocks of data are stored in printer RAM until the printer is available for printing. This process allows more efficient storage as well as concurrent compiling, rasterizing, and printing. This, in turn, provides faster printing speeds.

*QMS Compile-Ahead Technology Approach*

By separating the printing process into the two operations of compiling into an intermediate format and rasterizing, the printer does not have to re-create an entire page from scratch each time it is printed. The more time-consuming compilation operation is done only once per page. Each page may be printed multiple times simply by rasterizing the intermediate format.

An important feature of compile-ahead technology is simultaneous compiling, rasterizing, and printing. This capability changes what has traditionally been a sequential process into a parallel operation where several processes (compiling, rasterizing, and printing) work independently. In other words, the compiler changes the page description into intermediate blocks and stores them in memory; the rasterizer processes the intermediate blocks as needed by the print engine; and the print engine prints the pages. And all these tasks are done at virtually the same time.

Because the intermediate blocks are compiled ahead, stored efficiently, and processed quickly, after the first copy of a page is printed, all other copies of that page are printed at the printer's rated speed and in any order, including being automatically collated. In addition, parallel operation allows the printer to work on different phases of several print jobs at one time, employing the print engine more efficiently because it does not have to be turned off between print jobs.

## Emulation Sensing Processor (ESP) Technology

Most printers can recognize only their native command language. The QMS 4525, however, has ESP (Emulation Sensing Processor) technology. Using a form of artificial intelligence, ESP technology analyzes incoming file data from any of the printer's interfaces. ESP technology, which works with most popular commercially available applications, selects the appropriate emulation from those installed on the printer and processes the print job, freeing you from the need to manually change printer switch settings or send software commands to accommodate different printer languages.

On the QMS 4525, ESP automatically determines whether an incoming print job is in PostScript, PCL 5, imPRESS, LN03 Plus, or HP-GL printer command languages.

## Simultaneous Interface Operation (SIO)

Although many other printers have multiple interface ports and automatically designate a "hot port," only one port at a time actively receives information. Your QMS 4525 printer is unique because SIO allows all of its interface ports—LocalTalk, parallel, serial, and both optional network interfaces—to be active at the same time. Each interface has a configurable input buffer that receives data while another interface is being used to print. Think of each printer interface as a separate printer attached to a separate host computer or network. See chapter 11, "Printer-Host Connection," in the *System Administrator's Guide* for more information.

## Input Buffers

The QMS Crown operating system uses configurable input buffers that can receive large amounts of print data over any or all of the printer interfaces. This is done by providing a link between each interface's input buffer and the printer's main memory.

With RAM that is automatically partitioned by the printer controller, you can configure the size of the printer input buffers to best match the amount of print data that is expected over each interface. If incoming data over an interface exceeds the size you configured for that

interface, the data is buffered to main memory until all RAM is used. With these large, expandable input buffers, entire print jobs are sent in a single transmission. This not only increases the printer's performance, it also relieves the central processing unit (CPU) of time-consuming print data transmissions.

The QMS 4525 input buffers can also be configured for resident print job spooling, allowing the host to send multiple, successive jobs without CPU or user delays. In environments where a file server queues jobs, the file server is relieved of print jobs much faster. The Crown operating system provides a link between RAM and internal or external hard disk drives that are connected to the printer. This creates a kind of "virtual memory" that allows RAM to spill over to the hard disk, eliminating the need for additional print server hardware.

- **Compressed Data Formats**—Crown printers convert data received by the input buffers into intermediate, compressed blocks until the data is needed for printing. These compressed blocks of data are designed to be processed rapidly by the printer, and many more can be stored in memory at one time than can traditional bitmapped images.
- **Automatic Jam Recovery**—Crown technology also provides automatic jam recovery. With most printers, if a media jam occurs, you must remove the jammed media and then reprint the job. On a Crown printer, if a media jam occurs, once you remove the jammed media, the printer reprints the jammed page and then continues with the print job. This is possible because compressed data formats allow more pages to be stored in memory. The printer remembers the last page printed, pulls the necessary intermediate blocks from memory, and automatically reprints any lost pages. There is no need to resend the file.
- **User-Configurable Memory Clients**

On the QMS 4525, memory is divided among memory "clients." The size of most memory clients can be configured by the user (via the control panel or by software commands) to best meet specific printing, computing, and network needs. The following memory clients are on the QMS 4525 printer.

### **Spool Buffer Client**

The spool buffer client is used to hold data associated with print jobs. It is also used to hold any reverse channel data associated with a print job. Spool buffer memory allocation determines the number of simultaneous jobs which can be accepted for printing.

### **Temporary Storage Client**

The temporary storage client is used to hold downloaded fonts, forms, and other data for non-PostScript emulations. Adding memory to this client increases the number of downloaded fonts and forms that can be accepted.

### **PostScript Heap Client**

This client, also referred to as PostScript VM, is used to hold downloaded PostScript fonts and operators. Increasing PostScript Heap client memory permits printing of complex PostScript jobs and increases the number of fonts that can be downloaded to VM. Allocation of memory to this client should be increased only when the printer experiences VM errors while printing a job or downloading large numbers of fonts.

### **Font Cache Client**

This client is used by PostScript to cache previously scaled bitmap representations of PostScript fonts. This reduces the number of times a font must be converted from outline form to bitmap form, thus decreasing processing times. This client is used for PostScript fonts only.

### **Emulation Client**

This client is used for memory allocation by non-PostScript emulations. When an emulation is loaded to process a print job, and there is not sufficient memory, the current emulation is deleted to make room for the new emulation.

### **Display List Client**

The display list client holds the intermediate representation of pages to be printed. All Crown emulations produce these

intermediate blocks of compressed data. Increasing the allocation for this client increases chunk collation size and the number of jobs that can be compiled ahead.

### **Disk Cache Client**

The disk cache client stores frequently used data in system memory instead of continually storing and retrieving it from a hard disk. If a lot of hard disk access is required, adding memory to the disk cache may increase the printer's performance.

## Context Switching

Context switching allows Crown printers, when memory limitations permit, to preserve the state of an emulation (including downloaded fonts, forms, logos, macros, overlays, and other data) when you switch from one printer language or emulation to another. Many other printers do not have this capability and erase downloaded fonts and settings each time a user switches languages. Because the process of downloading fonts and forms can be very time-consuming, context switching significantly increases performance in environments where multiple emulations are used.

## Spooling Overflow

When a hard disk is attached to your printer, spooled print jobs can transparently spill over to the hard disk, so buffers are not limited to RAM capacity.

# 3

---

## Print Media

---

### In This Chapter . . .

- Print media
- Supported sizes and imageable areas
- About paper
- Configuring the paper bins
- Manual feed

# Introduction

The QMS 4525 prints on a variety of print media depending on whether you are using automatic or manual paper feed.

## ■ Automatic Feed

Automatic feed uses the upper and lower paper input bins in the paper compartment. You will notice later in this section that the input bins handle only paper in specific sizes and recommended weights. Only paper can be fed automatically. Refer to chapter 5, the "Feeding Paper" section, for complete information on feeding paper.

## ■ Manual Feed

You must use the manual feed slot to print on media other than paper. Refer to chapter 5, the "Feeding Paper" section, for complete information on feeding media.

# Media Sizes and Imageable Areas

Your printer supports paper, transparencies and other types of print media in a variety of sizes. (See chapter 5, the “Manual Feed” section, for specific paper type information.) Each size has a specific imageable area, the maximum area the printer is capable of printing for that size media. The imageable area is determined by hardware limits (the physical page size and the margins required by the print engine) and software constraints (the amount of memory available for the full-page frame buffer).

The following are the supported paper types and their imageable areas:

Paper Type	Inches		Millimeters	
	Page Size	Imageable Area	Page Size	Imageable Area
<b>Letter</b>	8.5 x 11.0	8.19 x 10.66	216 x 279	208 x 271
<b>Legal Large</b>	8.5 x 14.0	8.19 x 13.69	216 x 356	208 x 348
<b>A4</b>	8.3 x 11.7	7.95 x 11.37	210 x 297	202 x 289
<b>Quarto</b>	8.0 x 10.0	7.67 x 9.68	203 x 254	195 x 246
<b>Commercial</b>	8.3 x 10.6	7.95 x 10.31	210 x 270	202 x 262
<b>Foolscap</b>	8.0 x 13.0	7.67 x 12.67	203 x 330	195 x 322
<b>Folio</b>	8.3 x 13.0	7.95 x 12.67	210 x 330	202 x 322
<b>Legal Small</b>	8.5 x 13.0	8.1 x 12.67	216 x 330	208 x 322

- » *Note: If a requested paper size is not installed in the printer, then you are prompted via the console or control panel to install the correct paper.*

## About Paper

The quality of your print job depends in large part on the quality of the paper and storage method you select. You may achieve increased blacks and sharper contrast by using special laser printer paper which

is available from a variety of paper manufacturers. This paper is thicker, smoother, and whiter than copier paper and gives your page a more professional appearance. Textured paper may cause uneven results.

## Paper Weight and Type

The printer accommodates 13 to 45 lb (50 to 170 g/m<sup>2</sup>) paper. Conventional copier paper is suitable for most applications. Copier paper has a smooth surface, controlled electrical properties, heat stability, and cleanliness. This ensures satisfactory image transfer without excessive curl.

If you want to, you may also use special paper for specific applications. Bond papers (often used for stationery) generally have a watermark and often use cotton rather than wood fiber. Colored paper may also be used, but avoid using paper with a colored coating applied after the paper is made.

---

 **Caution:** When loading paper, be sure to discard the top and bottom sheets from every ream. The higher glue content of these sheets can cause paper jams and image degradation over time.

---

## Paper Storage

How you store paper can make a big difference in print quality and printer operation. Improperly stored paper increases the chance of paper jams during printing and can drastically affect the appearance of your printed pages. Keep paper in good condition by storing it

- In its wrapper
- On a flat surface
- In a closed cabinet
- In a cool, dry area

# Automatic Paper Feed

If you use automatic paper feed, the printer can be configured for a maximum of two paper sizes, and each paper input bin can be configured to accommodate one of the two paper sizes.

## Printer Paper Size Configuration

The possible combinations of paper sizes the printer can be configured for are

- Letter
- Legal Small
- Legal Large
- Quarto
- A4
- Commercial
- Foolscap
- Folio
- Letter and Legal Small
- Letter and Legal Large
- Letter and A4
- Quarto and A4
- Commercial and A4
- A4 and Foolscap
- A4 and Folio

## Input Bin Paper Size Configuration

Each of the two paper input bins can be configured for any one of the following paper sizes:

- Letter
- Legal Small
- Legal Large
- Quarto
- A4
- Commercial
- Foolscap
- Folio

» *Note: Input bin paper configuration must be done by a QMS Service Engineer.*

## Manual Feed

You must use the manual feed slot to print on any of the following. (Refer to appendix B, “Technical Specifications,” for information on this special media.) Documents are printed only to the side output bin, which has a capacity of approximately 100 sheets of 21 lb (80 g/m<sup>2</sup>) paper. Capacity for other media types and weights varies.

- » *Note: Some special materials may cause an image enlargement or reduction of up to 2% of the size normally expected.*
- Plain color/embossed 45 lb (170 g/m<sup>2</sup>) paper
  - Clear and color transparencies
  - PD300, PD500 and PD1000 offset plates
  - Adhesive labels
  - Durable form
  - Clear adhesive film

- Drafting film
  - Drafting paper
  - Preprinted paper (quick-drying and heat-proof ink)
  - 53 lb. (200 g/m<sup>2</sup>) paper
- » *Note: On 53 lb (200 g/m<sup>2</sup>) paper fusing is slightly reduced.*

## Unsupported Media Types

The following media is not supported:

- Thin offset plates such as PD200
- Recycled paper
- Vellum

# 4

---

# Daily Operations

---

## In This Chapter . . .

- Turning the printer on/off
- Dew prevention
- Loading paper
- Refilling toner
- Adjusting paper size switch
- Using the stapler
- Refilling staples
- Emptying output bins

# Introduction

This chapter explains many of the printer operations you will do frequently, including turning the printer on and off, loading paper, refilling tone, adjusting the paper size switch, using and refilling the stapler, and emptying the output bins.

## Turning the Printer On

Use the following procedure to turn the printer on:

- 1 Locate the power switch on the right-hand side of the printer.**

- 2 Press it to the | position.**
  - The printer diagnostics take 30 seconds to complete.
  - As each test is started, a message is displayed in the control panel message window to identify the test being executed.
  - If an error is detected, the appropriate error code is displayed in the control panel message window and at the console, and the next test is started.

# Turning the Printer Off

Leaving the printer turned on overnight causes unnecessary wear on the printer. You may also want to turn it off when it is not in use for several hours at a time. Use the following procedure to turn the printer off:

- 1 Press the Line key on the control panel to place the printer off line. Wait for all the pages of the current job to be processed and delivered into the sorter bin(s), stacker bin, or standard output bin. The following displays in the control panel message window:**

IDLE

- » *Note: You can press the Line key at any time, even when the printer is processing a job, in which case the messages*

1 ACTIVE JOB

INPUT IDLE

PRINTING

IDLE

*display, and the printer goes off line after all the pages in progress have been printed.*

- 2 Press the power switch to the O position to turn the printer off.**
- 3 Do not remove the power plug from the wall socket.**

## Dew Prevention Switch

The printer is equipped with a dew prevention feature which prevents excess humidity from building up inside the printer when it is off. As long as the dew prevention switch is on, dew prevention is automatically enabled when the printer is turned off.

- » *Note: Although the dew prevention unit consumes very little electricity*

(50 W), you can turn it off with a switch located behind the left front door of the printer. You should leave it on, however, to ensure reliable performance by the printer.

## Loading Paper

The printer has two ways of telling you to load paper in one or both input bins:

- 1 When the print job requests paper which is not physically in either of the input bins, this message displays:**

LOAD UPPER TRAY                      XXX PAPER

- 2 When the paper in one of the bins has reached the minimum level, the printer stops printing and displays the following message:**

LOAD UPPER TRAY                      XXX PAPER

- » Note: If you select inputbin chaining, this message appears only when the paper in both input bins approaches minimum levels.

**To load paper, use the following procedure:**

---

 Paper is packed in reams of 500 sheets. Do not unpack the paper above the printer as this might cause particles to fall into the printer components.

---

**1 Note the arrows on the wrapper.**

They show which side of the paper should be on the bottom when it is installed in the input bin(s).

- 2 Unwrap the paper, pull the stack out, and then with one hand at each end of the stack, lift and hold it in a curved position without gripping.**

- 3 Grip each end of the stack firmly.**

- 4 Straighten the stack, and then roll the fanned sheets from side to side.**

This gets air through the sheets and prevents static buildup.

- 5 Take off the top and bottom sheets.

---

**Caution:** When loading paper, be sure to discard the top and bottom sheets from every ream. Residual glue on these sheets can cause paper jams and image degradation over time.

---

- 6 Open the paper compartment by lifting the cover and opening the door.

**7 Press the Down button of the bin that you want to fill.**

Wait for the bin to lower and for the paper feed rollers to lift out of the way. Both input bins have an Up and a Down button on the left side of the paper compartment.

**⚠ WARNING:** To avoid getting your fingers caught between the moving bin and fixed parts of the paper compartment, keep your hands out of the paper compartment while the bins are moving.

**ACHTUNG!** Um ein Einklemmen und damit verbundene Verletzungen Ihrer Hand zu vermeiden, bitte niemals zwischen den beweglichen Papierbehälter und die fest installierten Papierbehälter fassen, wenn der Papierbehälter in Bewegung ist.

**8 Place the paper in the input bin.**

Put it on top of the existing stack, if there is one left, but do not slide it into the input bin since this may cause paper jams. Make sure the paper aligns with the stack.

**9 Check if the paper fits exactly between the left and right closure plates.**

If not, adjust the paper alignment by squeezing together the green levers underneath the bin, and then sliding them to the left so the right closure plate clicks into place against the paper stack.

**10 If you are loading paper in the upper bin, ensure that the paper-weight adjustment switch setting matches the weight of the new paper.**

Usually, paper weight is listed on the paper wrapper.

- The switch must be in the upward position if the paper weight is 16 to 27 lbs (60 to 102 g/m<sup>2</sup>).
- The switch must be in the downward position if the paper weight is 28 to 32 lbs (105 to 120 g/m<sup>2</sup>).

**11 Press the Up button of the refilled input bin.**

» *Note: If an input bin is left in the down position, the message*

LOAD UPPER TRAY                      XXX PAPER  
continues to display.

---

**Caution:** Do not adjust the paper alignment while the input bin is in the up position, as this can cause a paper jam.

---

**12 Lower the paper compartment cover and close the door.**

**13 If the Off indicator is lit, press the Line key to place the printer on line.**

## Refilling Toner

When the minimum level of toner is reached, the following message displays on the control panel:

TONER LOW

If the Toner Low Action option in the Administration/Engine menu is set to Continue, the printer continues to print after the warning message begins to display. If the option is set to Stop, the printer stops printing and waits for the toner bin to be refilled.

Use the following procedure to refill toner:

- 1 Open the left front door of the printer to gain access to the developing unit.**

- 2 Unlock the developing unit by pulling the green handle toward you and then turning it 180° counterclockwise.**

- 3 Grasp the metal handle and pull the developing unit out carefully until it stops.**

Notice that the toner bin comprises the upper part of the developing unit.

- 4 Remove the toner bin lid.**

Since there will be some toner on the underside of the lid, be careful where you place it.

- 5 Before opening each bottle, shake it to loosen the toner in the bottom.**

- 6 Carefully pour the contents of each bottle into the toner bin, moving the bottle back and forth to evenly distribute the toner.**

The toner bin holds up to  $3\frac{1}{2}$  bottles of toner.

---

**Caution:** If toner accidentally spills onto your clothing or work area, remove it by using a vacuum cleaner or cold water. Do not use hot water or harsh cleaning agents.

---

- 7 **Replace the toner bin lid, and push the developing unit back into its home position.**
- 8 **Pull the green handle toward you, then turn it 180° clockwise until the tab seats into the square hole in the metal handle of the developing unit.**
- 9 **Close the front door.**

## Adjusting the Paper Size Switch

If you have the stacker/stapler installed, a device in the upper output bin taps printed sheets into a neat stack. For this to work properly, the paper-size switch must be set to the correct paper size. The switch has three positions:

- |               |  |
|---------------|--|
| <b>Left</b>   | Foolscap (8.0", 203 mm)<br>Quartol (8.0", 203 mm)                                  |
| <b>Center</b> | A4 (8.3", 210 mm)<br>Commercial (8.3", 210 mm)<br>Folio (8.3", 210 mm)             |
| <b>Right</b>  | Letter (8.5", 216 mm)<br>Letter Large (8.5", 216 mm)<br>Legal Small (8.5", 216 mm) |

When you load paper into the input bins, check the paper size switch setting to ensure that it is set properly. If you load paper of different sizes in the two input bins, set the switch to the widest size.

# Using the Stapler

The system administrator sets the default stapling option in the Operator Control menu to enable or disable stapling. Multiple copies of print jobs are stapled individually.

Stapling requires the following:

- Staples must be loaded in the stacker/stapler.
- The print job must contain at least 2 sheets. Up to 35 sheets can be stapled and deposited in the upper or stacker output bins.
- The entire job can be held in the batch tray. The batch tray has a maximum capacity of 35 sheets, but the actual capacity is determined by the Bin Capacities option in the Administration/Engine/Finisher Setup menu.
- Stapling is enabled from the Administration/Engine/Finisher Setup menu, an application selection, the QMS DOC **staple** command, or a network print command.

# Refilling Staples

The optional stacker/stapler uses rolls of 10,000 staples. When a roll of staples is used up,

CHECK STAPLES

displays in the message window and on the local and remote consoles.

Use the following procedure to install a new roll of staples:

- 1 Open the stacker/ stapler top cover by pressing the release button located near the right-front corner of the cover.**

Lift the cover to the open position.

- 2 Gently press down on the top of the black plastic staple roll cover to release the top tab.**

- 3 Lift the cover out and lay it aside.**

- 4 Remove the retaining tape from a new roll of staples.**

- 5 Place the new roll in the roll holder with the leading end lying along the guide.**

- 6 Push the green lever to the left until the stapler clicks open.**

- 7 **Using your right hand, push the green lever to the right until you first feel resistance (just after the 12 o'clock position) and hold the lever there.**
- 8 **With your left hand, feed the staples along the guide and into the stapler until staples begin to protrude slightly.**
- 9 **Grip the protruding end of the staples with your fingers or pliers.**

Push the green lever all the way to the right to load the stapler and trim off the protruding staples. Discard the trimmed staples.

- 10 **Reinstall the staple roll cover carefully.**

Make sure the bottom edge snaps into the groove in the bottom of the roll holder.

- 11 **Lower the stacker/stapler top cover and press down until it clicks into place.**
- 12 **Make sure your print job staples correctly.**

Print an advanced status page or another multiple page document. The first set printed after staples are refilled will not be stapled. The next set of copies of your print job will be stapled.

# Emptying Output Bins

When one of the output bins becomes full,

OUTPUT BIN FULL

appears in the message display. To empty either output bin

**1 See that the bin is not receiving output.**

**2 Place your fingers on the bin release (under the front edge of the bin) and, with your thumb on top, squeeze to release the bin.**

**3 Slowly pull the bin out until it stops.**

**4 Remove the output stack.**

**5 Slowly push the bin back until it clicks into place.**

If you do not return the bin to its operating position,

UPPER TRAY OUT or LOWER TRAY OUT

continues to display. Properly seat the bin and press the Continue key.

## Printing Your Files

---

### In This Chapter . . .

- Printer job spooling
- Feeding and selecting paper
- Languages and emulations
- Selecting printer features
- Printing transparencies and labels
- Canceling print jobs
- Special pages

# Introduction

This chapter provides information on printing your files.

## Printing Your Files

The QMS 4525 printer is designed to serve a number of users in network environments. With ESP and SIO, the printer can be directly connected via serial, parallel, AppleTalk, and optional network interfaces, serving multiple hosts simultaneously.

If you are connected to the printer over a network, see your system administrator for specific instructions on printing files. There are many features on your QMS printer that may be customized to the requirements of your particular network. The system administrator can explain how the printer is configured for your network.

### QMS Document Option Commands (DOC)

If you are on a network, you can still use all your printer features when you want to. For example, you may want one file printed in PostScript, in duplex mode, and on letter-size paper and another file in simplex mode, in HP PCL 5, and on legal paper. Your printer provides a powerful feature that can accommodate your requests (and the requests of any other user on the network) without affecting the printer configuration for other jobs. This feature is the set of QMS Document Option Commands (DOC). See chapter 2, the "QMS Document Option Commands" section, for a list of printer-supported DOC commands.

With DOC, you can prepend special commands to the beginning of your files that cause the printer to perform specific file processing or document handling options. For instance, you can use DOC commands to specify a language or emulation, select a specific input bin or paper size, select duplex mode or simplex (single-sided) printing, and select page orientation. The features you select using DOC commands are in effect only for the printing of that file. After the file prints,

DOC commands prepended to the beginning of the next file (or the printer's default setup if no DOC commands are used) take effect.

## Printer Job Spooling

Another powerful feature of your QMS printer is the ability to “spool” (temporarily store) jobs received from the host. The printer receives jobs on a first-in-first-out (FIFO) basis. While it is printing one job, the printer can also be receiving and processing others. The printer's message window displays the number of jobs that are currently spooled or are being processed and printed:

```
3 ACTIVE JOBS
```

Part of the printer's internal hard disk is used to increase job spooling space.

## Feeding Paper

You can feed paper through the printer from the two paper input bins or the manual feed slot. For information on the input bins, refer to the following discussions on selecting input bins. For information about feeding paper manually, refer to “Manual Feed” later in this chapter.

## Selecting an Input Bin

Your printer has two input bins for automatic feed, and one manual feed slot.

The illustration below shows the locations of the input bins and the manual feed slot.

You must specify the paper that you want to use for your print jobs. There are two categories of paper selection:

### ■ Default paper

The default paper type or size is specified when the System Administrator selects the default input bin from the Operator Control menu. The default paper is always used whenever a paper size is not specified by an application, network print command, or QMS Document Option Command.

- **Current job paper**

An application, network print command, and/or QMS Document Option Command can specify the paper to be used for the current print job.

In addition to selecting the default paper from the control panel, you have the following ways to select paper for the current print job by specifying an input bin by name

- **Application**

Your application can specify paper by input bin name, paper size, or paper type.

- **Network print command**

Your network print commands can specify paper by input bin name, paper size, or paper type.

- **QMS Document Option Command**

You can use QMS Document Option Commands to specify paper by input bin name, paper size, or paper type.

## Using the Control Panel

The system administrator chooses a default paper input bin from the control panel or from a console. (See the system administrator's guide for additional information.) The printer uses paper from the default paper input bin if your file does not specify a paper size or paper input bin.

## Using QMS DOC Commands

Use the following QMS DOC command to select an input bin:

```
%%IncludeFeature: input (input bin number)
```

Your choices for *input bin number* are 1 (lower input bin), 2 (upper input bin), and *papersize \** (any input bin with the specified paper size; for example, letter \*). (See the *QMS Crown Document Option Commands* manual for complete information about using DOC commands in your files.)

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command parameter INPUT\_Input bin to select a paper input bin. The PRINT command syntax for input bin selection is

```
$ PRINT/QUEUE=queue/param=(input=bin1,output=bin2)
```

Replace *queue* with the appropriate queue name. Your choices for *bin<sub>1</sub>* are top and bottom, and your choices for *bin<sub>2</sub>* are top, bottom, and side. (See the *VMS Interface for QMS Printers* manual for complete information about using PRINT parameters.) If you select an input bin that is empty or has been removed, the printer waits for more paper to be loaded in the input bin or for the input bin to be replaced. If you use SHEET\_SIZE and INPUT\_Input bin, the paper size specified by SHEET\_SIZE must match the paper loaded in INPUT\_Input bin. If it does not, the printer stops printing, displays an error message, and waits for the correct paper size to be loaded in the specified input bin.

## Selecting Paper by Size

When you use a DOC, VMS, or UNIX paper size selection command, the printer searches the paper input bins for the matching paper size. When it finds a match, it uses paper from that input bin to print your file. If you know a certain size paper has been loaded in one of the paper input bins, you can use a paper size selection command to select the input bin containing that paper even if you do not know the input bin number or name.

## Using QMS DOC Commands

The QMS DOC command for selecting paper size is

```
%%IncludeFeature: input (size)
```

Your choices for *size* are letter, legal, a4, quarto, commercial, foolscap, folio, and legalsmall. (See the *QMS Crown Document Option Commands* manual for complete information about using DOC commands in your files.) If you use a value for *size* that is not loaded

in the printer, the printer stops printing until you load the specified paper size. The message

```
LOAD UPPER TRAY PAPER SIZE
```

displays on the control panel. *SIZE* is the paper size.

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command parameter SHEET\_SIZE to select paper size.

The following is the PRINT command for paper size selection:

```
$ PRINT/PARAM=(SHEET_SIZE=size) filename
```

Your choices for *size* are letter, legal, a4, quarto, commercial, foolscap, folio, and legalsmall. (See the *VMS Interface for QMS Printers* manual for complete information about using PRINT parameters.) If you use a value for *size* that is not loaded in the printer, but is a size for which the printer is configured, the printer stops printing until you load the specified paper size. If you use SHEET\_SIZE and INPUT\_Input bin, the paper size specified by SHEET\_SIZE must match the paper loaded in INPUT\_Input bin. If it does not, the printer stops printing, displays an error message, and waits for the correct paper size to be loaded in the specified paper input bin.

## Manual Feed

You must use the manual feed slot to print on the following. (For more information on special media, see appendix B, "Technical Specifications.")

- » Note: Some special materials may cause an image enlargement or reduction of up to 2% of the size normally expected.
  - Transparency film
  - Paper 13-16 lbs (50-60 g/m<sup>2</sup>)
  - Paper 32-45 lbs (120-170 g/m<sup>2</sup>)
  - Plain color/embossed 45 lb (170 g/m<sup>2</sup>) paper

- PD300, PD500 and PD1000 offset plates
  - Adhesive labels
  - Durable form
  - Drafting film
  - Drafting paper
  - Clear adhesive film
  - Preprinted paper (quick-drying and heat-proof ink)
  - 53 lb. (200 g/m<sup>2</sup>) paper
- » *Note: On 53 lb. (200 g/m<sup>2</sup>) paper, fusing is slightly reduced.*

### Do Not Use Unsupported Media

The following media is unsupported:

- Thin offset plates such as PD200
- Recycled paper
- Vellum

## Manual Feed Procedure

To use manual feed

### **1 Select manual feed from your application or specify manual feed in a print command.**

There are several ways to do this, depending on the application and the host you are using.

As soon as the printer is ready to print your job, the following message displays:

INSERT MANUAL FEED

- » *Note: If the timeout expires before you insert the sheet into the manual feed slot, the job is printed on paper from any available input bin.*

**2 Insert one sheet into the manual feed slot.**

The side on which you want to print must face down. The top of the sheet (important if you use pre-printed forms) must point to the front of the printer.

This means that when you are standing in front of the printer, the sheet must be fed face down with the top edge of the page toward you.

**3 As shown above, align the sheet against the input guide at the left end of the manual feed slot. The left edge of the slot is marked with ridges. Slide the paper into the slot.**

The page is pulled in, printed, and delivered to the output bin.

**4 If you selected multiple copies, do not insert the next sheet until the message**

INSERT MANUAL FEED

**displays again.**

## Side Output Bin

When you print from the manual feed slot, prints are sent only to the side output bin, which has a capacity of approximately 100 sheets.

- » *Note: Remove printed pages frequently. The printer does not notify you when the output bin is full; overfilling the output bin will cause paper jams.*

## Selecting a Language or Emulation

The QMS 4525 printer can process and print files that use the following languages or emulations:

- ESP
- PostScript
- imPRESS
- HP PCL 5
- HP-GL
- Lineprinter

- LN03
- CCITT Groups 3 and 4

## Selecting the Default Language or Emulation

The system administrator chooses a default language or emulation from the control panel or from a console. (See the system administrator's guide for additional information.) The default language is used for print jobs when the language is not specified by the application, the **DOC %%IncludeFeature: emulation** command, or network commands.

## Using ESP

ESP examines each file and selects the correct language or emulation for it. You can bypass ESP by selecting the appropriate language or emulation with QMS DOC or other network commands.

## Using QMS DOC

The QMS DOC command syntax for language/emulation selection is

```
%%IncludeFeature: emulation (language)
```

Your choices for *language* are esp, postscript, impress, pcl5, hpgl, lineprinter, ln03+, and ccitt. See the *QMS Crown Document Option Commands* manual for complete information.

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command parameter DATA\_TYPE to select a language or emulation.

The PRINT command syntax for language/emulation selection is

```
$ PRINT/PARAM=(DATA_TYPE=LANGUAGE)filename
```

Your choices for *LANGUAGE* are ESP, POSTSCRIPT, IMPRESS, PCL, HPGL, LN03+, and CCITT. Replace *filename* with the name of

your file. (See the *VMS Interface for QMS Printers* manual for complete information.)

### Using UNIX Commands

If you are connected to the printer through a UNIX host, and you have QMS UNIX host software installed, you can use the **-I** option to the **qpr** command to select a language or emulation.

The **qpr** command syntax for language/emulation selection is

```
qpr -llanguage filename
```

Your choices for *language* are esp, postscript, impress, hppcl, hpgl, ln03+, and ccitt. Replace *filename* with the name of your file. (See the *QMS UNIX Host Software* manual for complete information.)

## Duplex Printing

The QMS 4525 can print on both sides of any supported size paper. (See the system administrator's guide for information on printing combination simplex and duplex jobs on letterhead paper and three-hole-punched paper.)

There are two types of two-sided printing: duplex and tumble duplex.

The illustration below shows the difference between these two types. To use tumble duplex, duplex must also be selected.

## DUPLEX

## TUMBLE DUPLEX

### Selecting the Default Duplexing

The system administrator chooses the default settings (On or Off) for the duplex and tumble duplex options from the control panel or from a console. It is recommended that both duplex options be set to Off and that duplexing or tumble duplexing be selected by the application, the QMS DOC *duplex* command, or by a network print command. (See the system administrator's guide for additional information.)

## Using QMS DOC Commands

Use the following QMS DOC command to select duplex printing:

```
%%IncludeFeature: duplex (type)
```

Your choices for *type* are on (duplex printing), off (simplex printing), and tumble (tumble duplex). (See the *QMS Crown Document Option Commands* manual for complete information.)

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command parameter SIDES to select duplex printing.

The PRINT command syntax for duplex printing is

```
$ PRINT/PARAM=(SIDES=TYPE) filename
```

Your choices for *TYPE* are ONE (simplex printing), TWO (duplex printing), and TUMBLE (tumble duplex). Replace *filename* with the name of your file. (See the *VMS Interface for QMS Printers* manual for complete information.)

## Using UNIX Commands

If you are connected to the printer through a UNIX host, and you have QMS UNIX host software installed, you can use the **-d** or the **-t** option to the **qpr** command to select duplex printing.

The **qpr** command syntax for duplex printing is

```
qpr -d filename
```

The **qpr** command syntax for tumble duplex printing is

```
qpr -t filename
```

Replace *filename* with the name of your file. (See the *QMS UNIX Host Software* manual for complete information about using the **qpr** command.)

# Printing Multiple Copies

The QMS 4525 printer can print up to 1000 copies of your file. (See "Collating Output," later in this chapter, for information on how collation affects multiple copies.)

## Selecting the Default Copies

The system administrator chooses the default number of copies for all print jobs through the Configuration menu. (See the system administrator's guide for additional information.) The default number of copies are printed when the quantity is not specified first by the emulation (application or printer language) or next by the DOC **%%IncludeFeature: numcopies** command (this includes the network print commands).

## Using QMS DOC

The QMS DOC command syntax for multiple copies is

```
%%IncludeFeature: numcopies (number)
```

Your choice for *number* may be any number between 1 and 1000. If you use a number greater than 1000, only 1000 copies will print. If you want multiple copies of a job collated, you must use the collate command. (See the *QMS Crown Document Option Commands* manual for complete information.)

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command qualifier COPIES to print multiple copies.

The PRINT command syntax for multiple copies is

```
$ PRINT/COPIES=number filename
```

Your choice for *number* may be any number between 1 and 1000. If you use a number greater than 1000, only 1000 copies will print. (See the *VMS Interface for QMS Printers* manual for complete information.)

You may also use the VMS PRINT command qualifier JOB\_COUNT to print multiple collated copies of your entire print job. The PRINT command syntax using the JOB\_COUNT qualifier for multiple collated copies is

```
$ PRINT/JOB_COUNT=number filename
```

Your choice for *number* may be any number between 1 and 1000. If you use a number greater than 1000, only 1000 copies will print. (See the *VMS Interface for QMS Printers* manual for complete information.)

## Using UNIX Commands

If you are connected to the printer through a UNIX host, and you have QMS UNIX host software installed, you can use the **-#** option to the **qpr** command to print multiple copies.

The **qpr** command syntax for printing multiple copies is

```
qpr -# number filename
```

Your choice for *number* may be any number between 1 and 1000. If you use a number greater than 1000, only 1000 copies will print. (See the *QMS UNIX Host Software* manual for complete information.)

# Collating Output

Collation is the printing of sets of multiple copies of a document in numeric order. On the QMS 4525 Print System you can specify multiple copies of your document in uncollated or collated order, and you can direct them to either of the optional sorter bins or to the optional

stacker/stapler. The illustration below shows the collated and uncollated stacking for two copies of a three-page file.

**Collated**

**Uncollated**

The system administrator chooses the default collation setting for all print jobs via the Configuration menu. (See the system administrator's guide for additional information.) The default collation setting is used when collation is not specified first by the emulation (application or printer language), or next by the DOC *collate* command (this includes the network print commands). Some emulations are capable of specifying collation through language specific mechanisms such as the **setcollate** statusdict operators for level 1 or level 2. (See the system administrator's guide for information on this operator).

## Using QMS DOC

The QMS DOC command syntax to set collation is

```
%%IncludeFeature: collate (selection)
```

Your choices for *selection* are on and off. (See the *QMS Crown Document Option Commands* manual for complete information.) This overrides the Operator Control/Collation setting. Collation is set by the first subjob in a session and applies to all subsequent subjobs in the session unless explicitly reset by the option within the subjob. (See the

%%IncludeFeature: **newlayout** command in appendix E, the "DOC Commands" section of the *System Administrator's Guide*.)

## Selecting Page Orientation

You may select either portrait or landscape orientation.

Landscape

Portrait

The system administrator chooses the default orientation from Operator Control/Orientation option. (See the system administrator's guide for additional information.) The default orientation is used when the orientation is not specified by the printer or application language, the DOC %%IncludeFeature: **orientation** command, or by network print commands.

- » *Note: Since most applications support switching between orientations, it is best to leave the default set to portrait. Switching the default may cause unexpected results with respect to binding edges.*

## Using QMS DOC

The QMS DOC command syntax for page orientation is

```
%%IncludeFeature: orientation (selection)
```

Your choices for *selection* are portrait and landscape. (See the *QMS Crown Document Option Commands* manual for complete information.)

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command qualifier PAGE\_ORIENTATION to select orientation.

The PRINT command syntax for orientation is

```
$ PRINT/PARAM=(PAGE_ORIENTATION=SELECTION)- filename
```

Your choice for *SELECTION* is either PORTRAIT or LANDSCAPE. (See the *VMS Interface for QMS Printers* manuals for complete information.)

## Three-hole-punched Paper Orientation

On the QMS 4525 Print System paper is inserted print-side down. The hole placement must be as shown in the illustrations below for proper image orientation for both three-hole punching and stapling because staples are placed only in the top left corner on the physical page.

## Normal Duplex

Insert three-hole-punched paper with the holes as shown in these illustrations:

With the paper loaded like this the QMS 4525 Print System correctly prints portrait and landscape simplex or normal duplex pages.

## Tumble Duplex

Insert three-hole punched paper with the holes as shown in these illustrations:.

With the paper loaded like this the QMS 4525 Print System correctly prints portrait and landscape simplex or tumble duplex pages.

## Number Up Printing

Your printer has the capability to do number-up printing using QMS DOC commands. Number-up printing allows you to print a high volume of pages on less paper. For example, you may choose 2-up (two pages printed on one side of a page) or 4-up (four pages printed on one side of a page). Refer to the *QMS Crown Document Option*

*Commands* manual for complete information on how to do number-up printing.

## Stapling Your Print Jobs

If your printer has a stacker/stapler installed, you can staple print jobs of up to 35 sheets in the upper-left corner (portrait orientation) or the upper-right corner (landscape orientation).

The system administrator chooses the default setting for stapling. (See the system administrator's guide for additional information.) The default stapling setting is used when stapling is not specified first by the emulation (printer or application language), or next by the DOC **%%IncludeFeature: staple** command (this includes the network print commands).

### Using QMS DOC

The following is the DOC command syntax for stapling:

```
%%IncludeFeature: staple (selection)
```

Your choices for *selection* are on and off. (See the *QMS Crown Document Option Commands* manual and the system administrator's guide for more information.)

# Offset Stacking

Offset stacking separates multiple copies (stapled or unstapled) of print jobs by offsetting alternating sets 1.06" (27 mm).

The system administrator chooses the offset stacking default from the Administration/Engine Setup/Finisher Setup menu. (See the system administrator's guide for more information on this option). Offset stacking is also known as "jogging" and the terms are used interchangeably. The default jogging setting is used when stacking is not specified first by the emulation (printer or application language), or next by the DOC **%%IncludeFeature: offset** command (this includes the network print commands).

- » Note: Offset stacking takes effect only after the job is printed.

## Using QMS DOC

The following is the DOC command syntax for offset stacking

```
%%IncludeFeature: offset (selection)
```

Your choices for *selection* are on and off. (See the *QMS Crown Document Option Commands* manual and the system administrator's guide that comes with your printer for more information.)

# Printing on Transparencies and Labels

You can print transparencies for overhead projectors and sheets of self-adhesive labels with your printer.

## Printing Transparencies

Transparencies must be printed using manual feed. Use only transparencies recommended for use in laser printers. They should be able to withstand temperatures up to 200°F. Also, duplexing must be disabled.

- » *Note: To prevent jams, remove each transparency from the output bin as it comes out.*

## Printing Labels

Adhesive label stock is paper treated with pressure-sensitive adhesive backing. Use only label stock specifically designed for laser printing. Label stock must be fed face-down using manual feed, which delivers prints only to the standard output bin.

- » *Note: Make sure duplexing is disabled when printing labels.*

# Canceling a Print Job

This option allows you to cancel print job with the status of printing, interpreting, compiling, or spooled. The last page processed is printed and the remainder of the job is canceled. Jobs with statuses other than these are not canceled. If a console command identifying a particular document is used, only that document is canceled.

## Using the Control Panel

To cancel a print job from the control panel:

- 1 Press the Cancel key.**

**2 Select Yes. The following message displays:**

CANCELING JOB

**3 When all pages have been delivered to the side output bin,**

IDLE

**displays.**

» *Note: Do not turn the printer off to cancel a job.*

## Using a Console

You can use a local or remote console to cancel print jobs that are currently printing, interpreting, compiling, or spooling. (See the “Canceling a Job” section of the *QMS Crown Remote Console User's Guide* for more information.)

# Printing Special Pages

Special pages include the following:

- Start-up page
- Status page
- Header and Trailer pages

## Start-up Page

The printer start-up page prints each time the printer is turned on. The page provides the following printer information:

- **Product name**  
The product name, “QMS 4525,” prints in the upper-left corner of the page.
- **Printer name**  
The name of the printer specified with the Printer Name option of the Miscellaneous menu.

- **Pages printed**  
The number of pages printed by the current controller/hard disk configuration.
- **Interface**  
Current configurations of the standard and optional interfaces.
- **Release**  
Printer firmware release date.

## Printer Status Page

The printer status pages show the current default settings of many of the printer configuration options. There are two types of status pages: standard and advanced.

### Standard

The standard status page contains the printer identification information only. This information includes the product name, the printer firmware information, and the number of sheets printed to date.

### Advanced

The advanced status pages contain all of the following information:

- Printer identification (the product name, the printer name, firmware information, number of sheets printed)
- Printer settings (printer set-up options for paper handling)
- Current memory configuration (printer memory settings)
- Communication settings and input buffer sizes (settings for host-printer communication, including spooling memory sizes)
- Available typeface outlines (resident emulation fonts)

For information on choosing a status page type, see chapter 2, "Printer Configuration," in the system administrator's guide.

## Procedure

To print a status page, make sure the printer is on line and idle, and press the Status Page key.

## Printing Header and Trailer Pages

The QMS 4525 printer has the ability to print header and trailer pages between files. These pages, also known as banner pages or special pages, print before the first page of your file (header) and after the last page (trailer).

Header and trailer pages list the selected language or emulation, the printer-assigned job number, the file name, the start and completion times, and other information.

### Using QMS DOC

The QMS DOC command syntax for printing header pages is

```
%%IncludeFeature: header (selection [bin])
```

Your choice for *selection* is on, off, file, or onfile. The default setting is off.

- |            |  |
|------------|--|
| <b>On</b>  | Prints a header at the job boundary. If the job has subjobs, then you must use header(file) or header(onfile). |
| <b>Off</b> | Does not print header pages.   |

**File** Prints a header page prints at each subjob boundary. A job may be composed of several subjobs concatenated to make up a single document. For example, PostScript files may be concatenated together when separated by ^D, files may be combined using the **%%Session:** command over TCP/IP, or files printed through the serial or parallel interfaces with End Job Mode enabled may be combined. The header command must be in each subjob. The header page prints only at each subjob boundary. This command does not carry over to the next subjob. For example, if you have two subjobs with the header(file) command at the beginning of each subjob, then two file header pages print. If the header(file) command is placed in only one subjob, then only one file header page prints.

**Onfile** Prints a header page at the job boundary and the subjob boundary (if it is the first subjob). A job may be composed of several subjobs concatenated together to make up a single document. For example, PostScript files may be concatenated together when separated by ^D, files may be combined using the **%%Session:** command over TCP/IP, or files printed through the serial or parallel interfaces with End Job Mode enabled may be combined. The header command must be in the job and in its first subjob. The header page prints for the job and for the current subjob only. This command does not carry over to the next subjob.

For example, if you have two subjobs with the **%%IncludeFeature: header (onfile)** command at the beginning of the first subjob, the document header page and the file header page for the first subjob print. If header(onfile) is present in the second subjob, then the file header page for the second page prints. If header (onfile) is present in the first and second subjobs, then the document header page, file header page for the first subjob, and the file header page for the second subjob print.

You may also specify an input bin for the header page paper. Your choices for *bin* are the same as for selecting an input bin. (See “Selecting an Input Bin,” earlier in this chapter). See the *QMS Crown*

*Document Option Commands* manual for complete information about using DOC commands in your files.

The QMS DOC command syntax for printing trailer pages is

```
%%IncludeFeature: trailer (selection [bin])
```

Your choice for *selection* is on, off, file, or onfile. This option operates the same as the header option, except that it prints a trailer page instead of a header page. (See the **%%IncludeFeature: header** command, above, for a description of these selections.) The default setting is off.

You may also specify an input bin for the trailer page paper. Your choices for *bin* are the same as for selecting an input bin (see “Selecting an Input Bin,” earlier in this chapter). See the *QMS Crown Document Option Commands* manual for complete information about using DOC commands in your files.

## Using VMS Commands

If you are connected to the printer through a DECnet network, you can use the VMS PRINT command qualifier to print header and trailer pages.

The PRINT command syntax for special pages is

```
$ PRINT/SEPARATE=(FLAG,TRAILER) filename
```

If the print job is specified as a PostScript language job, the VMS system generates the special pages. If the job is any other language, the printer generates the special pages. Replace *filename* with the name of your file. (See the *VMS Interface for QMS Printers* manual for complete information about using PRINT parameters.)

# Troubleshooting

---

## In This Chapter . . .

- Paper jams
- Printer fails to print
- Preventing media jams
- Control panel status messages
- Printer problem checklist
- Other common printer problems
- Print quality problems

# Introduction

This chapter address common printer problems and provides instructions on how to correct them.

## Preventing Media Jams

Many media jams are caused by handling the media improperly. This section provides suggestions for the storage, handling, and loading of print media that will help you avoid common media-handling problems.

- Make sure the media is installed correctly and is not folded, wrinkled, or torn.
- Make sure the media is approved for use in the QMS 4525 printer. Refer to appendix B, "Technical Specifications."
- Discard the top and bottom sheets of every ream. The higher glue content of these sheets can cause paper jams and image degradation over time.
- Do not fill the paper input bins too full: the upper bin holds up to 600 sheets of paper, and the lower bin holds up to 1600 sheets.
- If the printer feeds double sheets, remove the paper from the paper bin and fan the edges. The sheets may be sticking together.
- Store media away from moisture and humidity that may cause the edges of media to turn up or wrinkles to occur. The recommended relative humidity during operation is 30%-80% non-condensing.
- Load the paper printing side down in the paper input bins. The printing side of the paper is indicated on the paper wrapping.
- If none of the above alleviates repeated media jamming, contact QMS Customer Assurance. Refer to appendix A, "QMS Customer Support," for information on customer support.

# Clearing Paper Jams

Since only paper is fed through the automatic paper-handling system, this section refers to “paper” jams rather than “media” jams. All other media is fed from the manual feed slot and is output into the standard output bin. The section on clearing paper jams in the manual feed slot applies to all print media.

A paper jam can occur at any of several points along the paper path. The printer paper path is comprised of three areas:

- Input path
- Duplex unit
- Output path

The remainder of this section describes how to locate and clear paper jams in these areas.

## Input Path Paper Jams

A paper jam can occur in the following locations:

- Lower paper input bin
- Upper paper input bin
- Manual feed slot

If one of the messages

PAPER JAM	UPPER INPUT BIN
PAPER JAM	LOWER INPUT BIN
PAPER JAM	INPUT PATH

appears, there is probably a paper jam somewhere in the input section of the printer. To clear a paper jam in the paper input section

**1 Open the paper compartment.**

**2 Check both paper input bins and remove any misfed paper at the paper feed rollers.**

**3 Make sure the paper in the bin is stacked properly and that no sheets are folded or bent.**

Check that the closure plates are aligned with the stack of paper. The closure plates should not press too tightly against the stack, but there should not be too much play.

## When You Have Finished

Once all jammed paper has been removed, press the Continue key on the control panel. The printer then resumes printing, starting with the paper not properly deposited in the standard output bin when the jam occurred.

- » *Note: If the same paper jam occurs often, make sure you are using a paper size and weight that is supported by the printer. Then see that the paper is correctly stacked in the paper input bin or aligned in the manual feed slot, and make sure the closure plate is correctly positioned and aligned against the right edge of the paper stack.*

## Duplex Unit Paper Jams

A paper jam can occur in the duplex unit at any one of the following locations:

- Duplex unit
- Duplex unit return path
- Under the manual feed plate

If the message:

PAPER JAM DUPLEXER

displays, there is probably a paper jam in one of these three areas.

If your printer has a sorter, use the following procedure to check for any paper jammed in the duplex unit.

---

**Caution:** Do not open the duplex unit cover or the sorter flap while the printer is processing or printing a page.

---

- 1 Grasp the handle on the duplex unit cover, and pull down the cover.**

Open Duplex Cover on a 20-Bin Sorter

Open Duplex Cover on a 40-Bin Sorter

» Note: The duplex unit covers differ on the 20-bin and 40-bin sorters.

---

**WARNING:** When removing jammed paper from the duplex unit, be careful! The metal section is hot.

**ACHTUNG!** Da die Metallteile sehr heiß sind, müssen Sie sehr vorsichtig sein, wenn Sie nach einem eventuellen Papierstau das Papier aus dem Duplexer entfernen wollen.

---

- 2 Remove any jammed paper and close the duplex unit cover.**

- 3 Check for any jammed paper in the return path of the duplex unit by pressing the lever below the duplex unit cover down.**

Remove any jammed paper.

- 4 If jammed paper cannot be removed from the duplex unit as described in the previous step, remove the manual feed plate.**

Grasp the plate using the two holes in the center and pull it slightly up and then out.

- 5 Remove any jammed paper, and replace the manual feed plate.**

---

**Caution:** If the manual feed plate is not replaced, paper can misfeed, causing another paper jam.

---

## When You Have Finished

Once all jammed paper has been removed, press the Continue key on the control panel. The printer then resumes printing, starting with those jobs not properly deposited in the standard output bin when the jam occurred. You must then reprint any damaged pages.

- » *Note: If the same paper jam occurs often, make sure you are using a paper size and weight that is supported by the printer. Then see that the paper is correctly stacked in the paper input bin or aligned in the manual feed slot, and make sure the closure plate is correctly positioned and aligned against the right-hand edge of the paper stack.*

## Output Path Paper Jams

A paper jam can occur along the output path in the

- Sorter bins
- Deposit valve

If a paper jam occurs along the output path, this message displays:

PAPER JAM    SORTER BIN

Use the following instructions to locate and clear the jam.

- 1 **Check each sorter bin and remove any paper which was not delivered correctly.**
  
- 2 **Open the hinged section of the sorter.**

If your printer has a 20-bin sorter, grasp the left rear corner and pull it to the left and toward you to swing it open.

If you have a 40-bin sorter, grasp the front left corner and pull it to the left to swing the left half open. Grasp the right front corner and pull it to the right to swing the right half open.

**3 Check for any jammed paper in the sorter flap by opening the sorter flap.**

Place your fingers in the indentation on the top edge of the flap and pull it to the left and down to open it.

---

**WARNING!** *The metal section of the sorter flap is hot. Do not touch it!*

**ACHTUNG!** *Um Verletzungen zu vermeiden, berühren Sie bitte niemals die Metallabdeckungen des Transportmechanismus, da sie sehr heiß sind.*

---

- 4 Lift the green handle A to raise the metal flap, and then remove any jammed paper inside the sorter flap.**

- 5 Pull down green handle B to open the sorter flap, and then remove any jammed paper.**

- 6 Close the deposit valve unit cover.**

- 7 Open the sorter unit.**

- 8 Remove any paper which is jammed in the sorter bins.**

» *Note: Environmental conditions may cause paper jams in the sorter. If these jams occur often, you may need to adjust the maximum sorter bin level. See your system administrator for help.*

- 9 Close the sorter unit, and lock it into position.**

- 10 Press the Continue key. Remove any pages delivered into the standard output bin.**

## When You Have Finished

Once all jammed paper has been removed, press the Continue key on the control panel. The printer then resumes printing, starting with those not properly deposited in the standard output bin when the jam occurred. You must then reprint any damaged pages.

- » *Note: If the same paper jam occurs often, make sure you are using a paper size and weight that is supported by the printer. Then see that the paper is correctly stacked in the paper input bin or aligned in the manual feed slot, and make sure the closure plate is correctly positioned and aligned against the right-hand edge of the paper stack.*

# Printer Fails to Print

If the printer is on but does not print when a job is sent to it, use the following procedure to identify and correct the problem.

- 1 Check the control panel for an error message and correct any indicated problem. Refer to “Control Panel Status Messages” later in this chapter.**
- 2 Make sure the printer is on line. The On indicator must be lit; if it is not, press the Line key to place the printer on line.**
- 3 If the message**

SERVICE CALL XXX

**displays, the printer has detected a serious error. Call QMS Customer Technical Assurance (CTA). Refer to appendix A, “QMS Customer Support,” for information on how to contact CTA.**

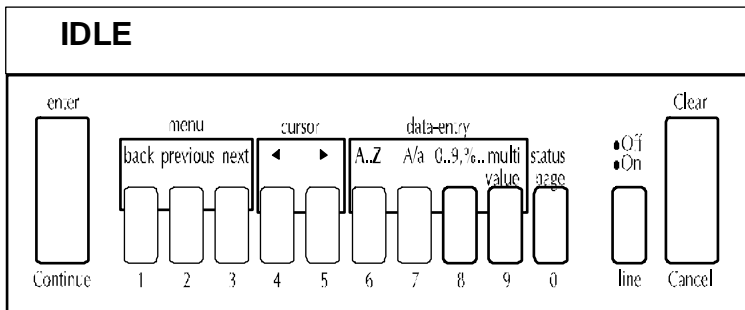

- 4 Check the host from which the job was sent for a message. Correct the indicated problem, if any.**
- 5 Check the host connection to the printer.**

# Control Panel Status Messages

Status messages in the control panel message display provide information about your printer and help you locate many problems. They are prioritized in order of severity with only the highest priority message displays.

When the status associated with a displayed message has changed, the message is cleared from the display and the next highest priority message is then displayed.

The illustration below shows the printer control panel:

## Power-Up Status Messages

The following status messages appear when the printer is first turned on:

### Boot System Loading

The Softloader is loading the system image and preparing to run it.

### Initializing

The Softloader is initializing and running internal diagnostics.

### **INITIALIZING**

The system image is now running and initializing the printer. The printer is ready to go on line.

### **QMS Softload x.x Ready to Boot**

The Softloader is waiting for user intervention in case you want to access Softloader functions. After a few seconds, it proceeds to load and run the system.

## Operational Status Messages

The following status messages may appear in the control panel message window and on the console when the printer is running

- » *Note: An engine error sometimes occurs as a result of an unusual combination of events rather than an actual problem. When an **ENGINE ERROR XXX** is detected, the printer displays the error message and continues to print the job.*

*If the error persists, it indicates a more serious condition, and the error message changes to **SERVICE CALL XXX** (XXX is the error number and it is the same for both the engine error and the service call). When you receive a service call error, you should call QMS National Service. (See appendix A, "QMS Customer Support," for more information.)*

### **xxxxxxxxxxxxx FILE IS FULL**

Indicates that the specified accounting file is full. (*xxxxxxxxxxxxx* represents the specified accounting file—Job Accounting file or Paper Accounting file.) If you want accounting enabled, copy these files to floppy disk/s or transfer them to your host computer using ftp (if available). Then reset the accounting files so that new jobs can be accepted. If you do not want to use accounting, you can disable it.

### **ACCOUNTING ALREADY DISABLED**

Indicates that the accounting option selected is now in effect.

### **ACCOUNTING ALREADY ENABLED**

Acknowledges that the option selected is now in effect.

### **ACCOUNTING DISABLED**

Acknowledges that the option selected is now in effect.

### **ACCOUNTING ENABLED**

Acknowledges that the option selected is now in effect.

### **ACCOUNTING FILES GOT REMOVED**

Indicates that accounting is disabled and the accounting files are empty. After a reset, the files are removed. This prevents you from wasting disk space with empty accounting files.

### **ACCOUNTING FILE IS xxx % FULL**

Indicates that the Job Accounting file is 80% or more full (xxx represents the percentage full in increments of 5%).

### **ACCOUNTING FILE NOT EMPTY, CANNOT SHRINK, KEEPING OLD SIZE**

Indicates that the Job Accounting file can be reduced in size only after a reset when the file is empty.

### **x ACTIVE JOBS**

Indicates that the printer is on line and that x number of jobs are in process.

### **CANCELING JOB**

Indicates the Cancel key has been pressed, and that print jobs with the status of printing, interpreting, compiling, or spooled will be canceled. This message is displayed until the canceled print job has been removed from the queue.

### **CHECK STAPLES**

Indicates that there is a problem with the staples. This generic error displays when any problem with the staples or a stapler jam has occurred. Refill the stapler or clear the stapler jam. See chapter 4, "Daily Operations," for more information on the stapler.

### **CLEANER LEVEL HIGH**

Indicates that the cleaner level is high. A high cleaning level does not cause the printer to stop printing immediately, but may result in bad print quality if allowed to persist. Call QMS Technical Assurance. See appendix A, "QMS Customer Support," for more information.

### **COULD NOT ENABLE ACCOUNTING, NOT ENOUGH DISK SPACE**

Indicates that the accounting files could not be created when accounting was enabled.

### **CREATED FILE**

Indicates that an accounting file is being created.

**CREATING xxxxxxxxxxxxxxxx FILE, PLEASE WAIT**

Indicates that the specified accounting file is created when accounting is enabled and the files are not in existence or these files are created following a Reset Accounting. (xxxxxxxxxxxxxxxxxxx represents the Job Accounting or Paper Accounting file.

**ENGINE ERROR 20**

Indicates that the buffer speed is out of specification during scan. The printer displays this warning error and continues to print the job.

**ENGINE ERROR 21**

Indicates that the buffer did not reset at the start of a print cycle. The printer continues to print the job.

**ENGINE ERROR 22**

Indicates that the buffer did not give the SOP signal in time. The printer continues to print.

**ENGINE ERROR 24**

Indicates that no PAV signal was received after the SOP has been transmitted. The printer continues to print the job.

**ENGINE ERROR 30**

Indicates that the corona did not charge. The printer continues to print the job.

**ENGINE ERROR 40**

Indicates the side framing lamps A and /or B failed. The printer continues to print the job.

**ENGINE ERROR 41**

Indicates that the side framing lamp C failed. The printer continues to print the job.

**ENGINE ERROR 50**

Indicates that both cross framing lamps failed. The printer continues to print the job.

**ENGINE ERROR 90**

Indicates that the TTF temperature is out of specification. The printer continues to print the job.

**ENGINE ERROR 91**

Indicates that the feed plate temperature is out of specification. The printer continues to print the job.

**ENGINE ERROR 92**

Indicates that the delivery belt temperature is out of specification. The printer continues to print the job.

**ENGINE ERROR 93**

Indicates that the TTF heater is faulty. The printer continues to print the job.

**ENGINE ERROR 94**

Indicates that the feed heater is faulty. The printer continues to print the job.

**ENGINE ERROR 95**

Indicates that the delivery heater is faulty. The printer continues to print the job.

**ENGINE ERROR 120**

Indicates an image transfer error. The printer continues to print the job.

**ENGINE ERROR 140**

Indicates that the erase lamp failed. The printer continues to print the job.

**ENGINE ERROR 170**

Indicates that an accurate upper paper level cannot be calculated. The printer continues to print the job.

**ENGINE ERROR 171**

Indicates that the stacker lower tray didn't reach the correct position. The printer continues to print the job.

**ENGINE ERROR 210**

Indicates that the stacker lower tray didn't reach the correct position. The printer continues to print the job.

**ENGINE ERROR 211**

Indicates that the stacker upper tray didn't reach the correct position. The printer continues to print the job.

**ENGINE ERROR 215**

Indicates a stacker lower tray jog error. The printer continues to print the job.

**ENGINE ERROR 216**

Indicates a stacker upper tray jog error. The printer continues to print the job.

**EXTENDED ACCOUNTING FILE SIZE**

Indicates that the size of the non-empty accounting file has been increased successfully.

### **EMPTY *xxx* OUTBIN**

Indicates that the output bin is full. Remove the output from the output bin. This error occurs only on the stacker/stapler. The stacker/stapler has three output bins: an upper output bin, a stacker bin, and an internal batch bin. The capacity of the upper output bin is fixed at 500 sheets, the internal batch tray and the stacker bin is selectable—500 to 1700 sheets. The maximum sheet capacity for these output bins is controlled by the Bin Capacities option in the Administration/Engine Setup/Finisher Setup menu.

### ***xxx* DOOR OPEN**

Indicates that either the duplexer or finisher side door (*xxx* indicates which door) is open. Close the door as indicated in the “Clearing Paper Jams” section, earlier in this chapter, for more information.

### **FINISHER TOP OPEN**

Indicates that the finisher top is open. Close the top.

### **FIN LOWER TRAY OUT**

Indicates that the finisher lower tray is out. Push the tray back in.

### **IDLE**

Indicates that the system is on line, but no jobs are in process.

### **INPUT IDLE PRINTING**

Indicates that the printer is on line and printing jobs that are already in the queue; no new jobs are arriving at the communication interfaces.

### **INSERT MANUAL FEED**

Indicates that the printer is waiting for paper in the manual feed slot. Load paper in the manual feed slot. See chapter 5, the “Manual Feed” section, for information on manual feed.

### **KEYPAD LOCKED**

Indicates that a console is being used, so input to the control panel is locked. If you want to use the control panel, exit from the console and the message is removed, the printer goes on line, and the `IDLE` message displays in the control panel message window.

### **LOAD *xxx* TRAY *yyy* PAPER**

Indicates that the paper in the *xxx* input bin (either the upper or lower input bin) has run out. Reload the input bin; *yyy* identifies the correct paper size. (See chapter 4, “Daily Operations,” for loading information.) You will receive the `LOAD ANY TRAY yyy PAPER ERROR` only when tray chaining is enabled.

### **LOWER TRAY OUT**

Indicates that the lower tray is down and must be raised for printing to resume.

### **NEW FILE SIZE WILL TAKE EFFECT WHEN ACCOUNTING IS ENABLED**

Indicates that since accounting is disabled, the file with the new size will be created only when accounting is enabled.

### **OUTPUT BIN ALMOST FULL**

Indicates that the output bin is almost full. This is a warning message that displays about 20 pages before you receive an `OUTPUT BIN FULL` error. Remove the paper stack from the output bin.

### **OUTPUT BIN FULL**

Indicates that the current sorter output bin is full. This error occurs when the output bin is about 95% full. Remove the pages from the sorter bin currently filled and printing starts again. The printer continues depositing pages to the sorter bin until either the job is finished, or until it detects that the bin is nearing capacity. The Maximum Capacity option in the Administration/Engine Setup/Sorter Setup menu.

### **PAPER JAM IN xxxxxxxxxxxx**

Indicates that a media jam has occurred while a job was being printed. (xxxxxxxxxxxx represents the area of the printer where the media jam occurred—upper input tray, lower input tray, duplexer, sorter door, sorter bin, or stapler unit). Remove the media jam and press the Continue key to resume printing. See the section on paper jams earlier in this chapter.

### **PAPER LOW xxxxxx**

Indicates that there are about 50 sheets left in either the upper or lower tray, or both trays. This message is a warning, but when you try to print a `PAPER OUT xxxxxx` error displays. Fill the specified paper tray.

### **PAPER OUT: xxxxxx**

Indicates that the specified input bin is empty. Load any paper in the specified input bin.

### **PRINTER READY**

Indicates that there are no error or warning messages on the printer.

### **PRINTING STATUS**

Indicates that a status page has been requested via the Print Status option in the Administration/ Miscellaneous menu. The message clears after the status page prints.

## **RESETTING ACCOUNTING**

Indicates that the Reset Accounting operation is in progress.

## **SERVICE CALL 20**

Indicates that the buffer speed is out of specification during scan. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 21**

Indicates that the buffer did not give the SOP signal in time. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 22**

Indicates that the buffer did not give the SOP signal in time. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 24**

Indicates that no PAV signal was received after the SOP has been transmitted. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 30**

Indicates that the corona did not charge. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 40**

Indicates that the side framing lamps A and /or B failed. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 41**

Indicates that the side framing lamp C failed. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 50**

Indicates that both cross framing lamps failed. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

## **SERVICE CALL 90**

Indicates that the TTF temperature is out of specification. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 91**

Indicates that the feed plate temperature is out of specification. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 92**

Indicates that the delivery belt temperature is out of specification. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 93**

Indicates that the TTF heater is faulty. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 94**

Indicates that the feed heater is faulty. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 95**

Indicates that the delivery heater is faulty. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 120**

Indicates an image transfer error. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 140**

Indicates that the erase lamp failed. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 170**

Indicates that an accurate upper paper level cannot be calculated. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 171**

Indicates that an accurate upper paper level cannot be calculated. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

**SERVICE CALL 210**

Indicates that the stacker lower tray didn't reach the correct position. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

### **SERVICE CALL 211**

Indicates that the stacker upper tray didn't reach the correct position. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

### **SERVICE CALL 215**

Indicates a stacker lower tray jog error. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

### **SERVICE CALL 216**

Indicates a stacker upper tray jog error. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

### **SERVICE CALL UNK**

Indicates that the printer has encountered an untrapped error. Contact QMS National Service. See appendix A, "QMS Customer Support," for information on how to get help.

### **SORTER DOOR OPEN**

Indicates that the sorter door is open. Close the sorter door.

### **TONER LOW**

Indicates that the toner is low. Refill the toner bin. See chapter 4, "Refilling Toner" earlier in this chapter, for information on refilling the toner bin.

### **TRAY DOWN xxxxxx**

Indicates that either the upper or lower tray, or both trays are down. This error is a warning. Raise the tray by pressing the Tray Up key to resume printing.

### **UNKNOWN ERROR**

Indicates that the printer has encountered an untrapped error. Contact National Service. See appendix A, "QMS Customer Support," for information on how to get help.

### **UPPER TRAY: DOWN**

Indicates that the upper tray is down and must be raised for printing to resume.

### **WAITING FOR INPUT END JOB?**

Indicates that the printer compiler is waiting on incoming data for the first job in the job queue. It is possible that the job did not end with an end-of-job indicator and therefore cannot end by itself. The message is displayed in case you want to use the Cancel key to cancel the job or send an end-of-job indicator. The message disappears if more input arrives from the port or if you use the Cancel key. No other jobs can be printed until this job has ended.

### **WARMING UP PLEASE WAIT**

Indicates the printer is warming up after being turned on or is resetting an error.

## Error Messages

If you have a problem that you cannot resolve, contact QMS Customer National Service. See appendix A, "QMS Technical Support," for information on how to get help. The following service call message requires that you contact QMS Customer National Service:

SERVICE CALL XXX

# Problem Checklist

This section provides a list of possible printer problems and solutions. If there is no status message, use the following steps to identify the source of your problem and to determine possible solutions:

- 1 Do the On or Off indicators on the printer control panel come on? If they do not, check the following:**
  - Is the power cord plugged into both the power outlet and the printer?
  - Is the printer turned on?
  - Is the controller turned on?
  - Is the power outlet working?
  - Does the line voltage from the power outlet match the printer's power requirements? (See appendix B, "Technical Specifications.")
- 2 Can you print a status page? If you cannot, check the following:**
  - Did you take the printer off line before you tried to enter the menu structure?

- Does at least one paper input bin contain paper? If not,

LOAD UPPER TRAY XXX PAPER

displays.

- Is there a media jam?

### 3 Is the printer receiving data from the computer?

- Is the printer on line? The message display should display IDLE, and the On indicator should be lit.
- Has the interface port been set to a language or emulation that does not match the file you are sending?
- If you are using the serial interface, is the baud rate (speed of data transmission) of the printer, the computer, and your application software the same? Print a status page from the control panel to check your printer setting.
- If you still cannot identify the problem, contact QMS Customer Technical Assurance.

### 4 Is the printer printing codes or not printing at all when in ESP mode? If one of these things is happening, check the following:

- Reconfigure the port to the specific printer language of the file you are trying to print. See your system administrator.
- If a PostScript file prints PostScript language statements while in ESP mode, increase the ESP timeout. (See the *System Administrator's Guide* for instructions.)
- If you continue to have problems with the ESP mode selecting a printer emulation, contact QMS Customer Technical Assurance. See appendix A, "QMS Customer Support," for information on customer support.

## Apple Macintosh Checklist

If you are experiencing problems with printing (not related to print quality), check the following:

- Is the printer properly connected to LocalTalk?
- Have you used the Chooser to choose "LaserWriter" and "QMS 4525 Print System"? The printer's current name (as it appears on the console) is the name that appears in the Macintosh's chooser box.
- Is AppleTalk or EtherTalk active in the Chooser dialog box?
- Is the printer type correct? The default printer type is "LaserWriter."

## IBM PC Compatible Computer Checklist

If you are experiencing problems with printing (not related to print quality), check the following:

- Does your application setup match the printer interface settings?
- Have you set up your printer port at the system level (DOS) and installed a printer driver in your application? (Refer to your DOS and application documentation.)
- If you are using RS-232C serial interface, are you experiencing a protocol problem? Set the printer to DTR/DSR protocol. If that does not work, check your serial interface cable.

# Other Common Printer Problems

## No Start-up Page

If no start-up page prints, check the following:

- 1 Is the printer on line?**

- 2 Has the start-up page been disabled? Use the printer control panel to make sure the start-up page is enabled.**
- 3 Turn the printer off. From a cold start, it takes less than five minutes for the printer to warm up. Be sure you wait long enough for a start-up page before suspecting a problem.**

## Not All Pages Print

If not all of the pages of your document print, check the following:

- 1 Check your cable. You could have the wrong kind of cable, or your printer may not be configured for the correct cable and port.**
- 2 Check the control panel message display to see if the paper input bins are empty.**
- 3 Make sure someone did not turn the printer off when clearing a media jam. Automatic jam recovery works only if the system remains on.**

## Media Jam Message Stays On

If a PAPER JAM *XX* message displays, clear the jam and press the Continue key. (*xx* identifies the location of the paper jam.) See the "Clearing Paper Jams" section earlier in this chapter for more information.

## Netware Banner Page Job Does Not Print

If you experience problems when printing a job using Netware with a banner page, change the Administration/Network 1 or Network 2/PS Protocol value to Quoted Binary or Quoted Binary Fixed.

# Preventing Inaccurate Bin Level Readings

When the sorter is available on your printer, you should do the following to prevent inaccurate bin level readings:

- Do not put paper in an empty sorter bin.

If you do, the printer thinks that the bin still contains the number of sheets that it contained from the last print job. For example, if the bin contained 50 sheets from the last print job and you place a sheet in it before the next print job, the counter remains set at 50.

- Do not switch the printer off while the sorter contains output.

When it is switched back on, the bin-level counters remain set even though the output has been removed. All of this means that your next print job will not sort correctly due to inaccurate bin level readings.

## Print Image Problems

Partial images may be caused by trying to print outside of the imageable area, timing problems, or belt speed problems. Try one of the following suggestions to correct the problem:

- Change to a larger size paper.
- Adjust the margin(s) through your application.

# A

---

## QMS Customer Support

---

### In This Chapter . . .

- Sources of customer support
- QMS world-wide offices

# Sources of Support

Several sources of help and information are available, depending on the type of help you need:

## Your QMS Vendor

Your local vendor (the one from whom you bought the printer) may be best equipped to help you. Your vendor has specially trained service technicians available to answer questions, and the equipment to analyze your printer problems.

## Your Application Vendor

Often, "printing" problems have more to do with the application being used than with the printer. In this case, the application manufacturer is the best source of help.

## Q-FAX

Q-FAX, a QMS information retrieval service, provides application notes, technical support notes on common printing problems, and information about printer specifications, options, accessories, consumables, and prices.

In the United States and Canada, call (800) 633-7213 to reach Q-FAX. In all other countries, call (205) 633-3850. Have your fax number handy when you call (or place the call from your fax machine's handset).

» *Note: The 205 area code will change to 334 on January 15, 1995.*

You can choose to have either a directory (a list of currently available documents on a particular topic) or a specific document sent to you. The first time you call, request the directory (press 2 on your phone or fax keypad when prompted). Then call back to request specific documents. You can order up to three documents per call.

## The QMS Corporate Bulletin Board System

The QMS Corporate Bulletin Board System (BBS) contains technical support notes, application notes, drivers, patches, and utilities, and you may leave technical questions not requiring an immediate response on electronic mail for the Sysop (System Operator).

The bulletin board [(205) 633-3632] operates at 1200, 2400, 9600, and 14400 baud, 8 data bits, no parity, 1 stop bit, with XMODEM and YMODEM capabilities. Contact QMS Customer Technical Assurance for more information about the bulletin board.

» *Note: The 205 area code will change to 334 on January 15, 1995.*

## CompuServe

Through CompuServe, you ask general (non-technical) questions, share information with other users, and access printing information and programs. When you use CompuServe, type one of the following commands:

- `go qmsprint` takes you to the DTP Vendor forum; QMS is section 3 of that forum

The QMS library section contains application notes, printer drivers, utilities, technical information, and announcement files.

## Internet

The QMS server provides access to technical reports, new product announcements, a trade show schedule, and other general information about QMS.

You can access the QMS server via any one of the many web viewers available to Internet users. If you don't have access to a web viewer, we recommend the NCSA Mosaic web viewer (Mosaic is at <ftp.ncsa.uiuc.edu>). The QMS home page is at <http://www.qms.com/>. The QMS ftp resource is <ftp.qms.com>.

## QMS National Service

If you have a problem you cannot resolve, contact QMS National Service. The following service call message requires that you contact QMS National Service:

SERVICE CALL xxx

### Phone Numbers

<b>(800) 762-8894</b>	Service information and maintenance pricing for QMS and other manufacturers printer's
<b>1-800-858-1597</b>	On-site service and depot repair information 7 a.m. to 7 p.m. Central Time
<b>1-205-633-4300</b> <b>Extension 2530</b>	Spare parts ordering and information 8 a.m. to 5 p.m. Central Time

- » *Note: The 205 area code will change to 334 on January 15, 1995. The above numbers are valid in the United States. To contact QMS in other countries, see the "World-wide Offices" section later in this appendix.*

## QMS Customer Technical Assurance (CTA)

QMS Customer Technical Assurance is available from 7 a.m. to 6 p.m., Central Standard Time, at (205) 633-4500 (US). You can also fax questions to CTA at (205) 633-3716 (US). Please indicate whether you would like a faxed or a phoned reply.

» *Note: The 205 area code will change to 334 on January 15, 1995.*

If you call for assistance, have the following information ready so our technicians can help you more quickly:

- Your phone number, fax number, and shipping address
- A description of the problem
- The printer model
- The type of host computer you are using
- The type and version of operating system you are using
- The interface you are using, and, if serial, the protocol
- The application and version you are using
- The emulation you are using
- Your printer firmware version (listed on the status and start-up pages)

# B

---

## Technical Specifications

---

# Print Engine Specifications

## Type

Electronic laser printer, floor model.

## Resolution

300 dpi (dots per inch) or 12 dots per millimeter.

## Laser Safety

The overall printer operating condition is Laser Class 1 apparatus according to IEC 825. There is no radiation outside the printer.

## Printing Speed

Maximum of 45 prints per minute.

## Warm-up Time

Less than 6 minutes.

## Input Bins

### Upper Input Bin

- **Capacity**

600 sheets of 20 lb (75g/m<sup>2</sup>) paper  
400 sheets of 32 lb (120 g/m<sup>2</sup>) paper

- **Supported Paper Weights**

16 to 32 lbs (60 to 120 g/m<sup>2</sup>)

## Lower Input Bin

- **Capacity**

1600 sheets of 20 lb (75 g/m<sup>2</sup>) paper

- **Supported Paper Weights**

20 to 27 lbs (75 to 100 g/m<sup>2</sup>)

## Input Bin Configuration

Each input bin can be configured to accommodate one size paper. The possible combinations for the two input bins are

- letter and legal small
- letter and legal large
- quarto and A4
- commercial and A4
- letter and A4
- A4 and foolscap
- A4 and folio

» *Note: Paper input bin configuration must be done by a QMS Service Engineer.*

## Output Bins

### Standard Output Bin

- **Capacity**

Maximum of 20 sheet

### Output Bin Options

- **20-bin face-down sorter**

Total capacity—2000 sheets

Each sorter bin can hold a maximum of 100 sheets of 16 to 27 lb (60 to 100 g/m<sup>2</sup>) paper or a maximum of 50 sheets of 27 to 32 lb (100 to 120 g/m<sup>2</sup>) paper.

■ **40-bin face-down sorter**

Total capacity—4000 sheets

Each sorter bin can hold a maximum of 100 sheets of 16 to 27 lb (60 to 100 g/m<sup>2</sup>) paper or a maximum of 50 sheets of 27 to 32 lb (100 to 120 g/m<sup>2</sup>) paper.

■ **Stacker/stapler**

Total capacity—2200 sheets: 500 in the upper bin and 1700 in the stacker bin, with offset stacking of 1" (25 mm).

Staples and stacks a maximum of 35 sheets.

■ **Side output bin**

The side output bin can hold a maximum of 100 sheets of 21 lb (80 g/m<sup>2</sup>) paper. The total capacity of other media varies.

## Photoconductor

Endless belt with light sensitive ZnO layer.

## Charging System

Twin corona wire, about 7.5 kV.

## Exposure System

20 mW infra-red (800 nm) semiconductor laser. Spinner with 10 facet polygon mirror.

---

⚠ **Caution:** *Laser class 3B can damage your eyes.*

---

## Developing System

Magnetic brush development with mono-component toner. Toner can be refilled by the system administrator or by a QMS Service Engineer.

## Fusing Mechanism

Heat and pressure.

## Toner

Print capacity per 3.2 lb (1.45 kg) bottle of toner: 55,000 prints.

Total toner bin print capacity—192,500 prints.

## Cleaning System

Magnetic brush cleaning.

## Power Consumption

The following figures reflect the average power dissipation per hour:

- Switched off (only dew prevention functioning): 50 W
- During warm-up: 3500 W
- On stand-by: 800 W
- Operating: 1750 W
- During printing (with 20-bin sorter installed): 2100 W

## Electrical Requirements - US Version

- One phase 208 V (+10%); max. 16 A; 60 Hz (+2%)
- One phase 230 V (+10%); max. 15 A; 60 Hz (+2%)

# Physical Specifications

## Weight

- Print engine 860.0 lbs (418 kg)
- 20-bin sorter 167.6 lbs (76 kg)
- 40-bin sorter 253.6 lbs (115 kg)
- Stacker/stapler 180.8 (82 kg)

## Weight of Packaging

- Print engine 143.3 lbs (65 kg)
- 20-bin sorter 22.1 lbs (10 kg)
- 40-bin sorter 26.5 lbs (12 kg)
- Stacker/stapler 28.7 lbs (13 kg)

## Weight of Consumables

- Bottle of toner 3.2 lbs (1.45 kg)
- Pack of 21 lb (80 g/m<sup>2</sup>) A4 paper 5.5 lbs (2.5 kg)
- Master belt 2.2 lbs (1 kg)

## Outer Dimensions

### Height

- Without sorter 41.6" (1055 mm)
- With 20-bin sorter 77.0" (1955 mm)
- With 40-bin sorter 86.3" (2190 mm)
- With stacker/stapler 63.1" (1600 mm)

### Width

- Without buffers 56.3" (1430 mm)

- With buffers 57.7" (1465 mm)

### Depth

- Without buffers 29.0" (735 mm)
- With buffers 30.3" (770 mm)

## Space Requirements

- **For operator:** 24" (600 mm) at the front, on the right-hand and the left-hand side
- **For service:** 24" (600 mm) on all sides
- **Angle of inclination:** Maximum of 4°

## Room Ventilation

**Recommended:** Minimum of 438 cubic feet/hour (12.5 m<sup>3</sup>/h)

## Room Volume

**Recommended:** Minimum of 855 cubic feet (25 m<sup>3</sup>)

With this room volume and the recommended room ventilation the ozone emission is within the Threshold Limited Value for ozone (0.2 mg/m<sup>3</sup>).

---

**Caution:** For removal of heat, extra ventilation may be necessary.

---

## Acoustic Noise Emission

- Stand-by: maximum 47 db (A)
- Printing: maximum 64 db (A)
- Impulse: maximum 73 db (A)

---

**Caution:** Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

---

# Hard Disks

Only QMS 344 MB internal and external hard disks are approved. Contact your QMS vendor. See appendix A, "QMS Customer Support," for a information on how to contact your QMS vendor.

# Print Media Specifications

## Supported Print Media

### Input Bins

- Plain, colored, and letterhead paper—16 - 32 lb (60 - 120 g/m<sup>2</sup>)

### Manual Feed

- » *Note: Some special materials may cause an image enlargement or reduction of up to 2% of the size normally expected.*
  - Plain, color, and letterhead paper—13 - 45 lb (50 - 170 g/m<sup>2</sup>)
  - Plain paper—53 lb (200 g/m<sup>2</sup>)
  - » *Note: The fusing is slightly reduced on this weight paper.*
  - Plain color/embossed paper—45 lb (170 g/m<sup>2</sup>)
  - Clear and color transparencies
  - PD300, PD500, and PD1000 offset plates
  - Adhesive labels
  - » *Note: To minimize the risk of gumming up the photoconductor belt, use adhesive labels with a glue area somewhat smaller than the paper area.*
  - Durable form
  - Clear adhesive film

- Drafting film
- Drafting paper
- Preprinted paper (quick-drying and heat-proof ink)
  - » *Note: The ink must be heat-resistant up to 320° F (160° C) for 0.6 seconds and pressure-resistant up to 38.7 lb/in<sup>2</sup> (6 kg/cm<sup>2</sup>) for 45 milliseconds.*

## Do Not Use

The following media is unsupported:

- Thin offset plates, such as PD200
- Recycled paper
- Vellum

## Print Media Sizes and Imageable Areas

Your printer supports paper and transparencies in three sizes. Each size has a certain imageable area, the maximum area capable of being printed on. It is subject to both hardware limits (the physical page size and the margins required by the printer engine) and software constraints (the amount of memory available for the full-page frame buffer).

Following are the supported paper types and their imageable areas:

Paper Type	Inches		Millimeters	
	Page Size	Imageable Area	Page Size	Imageable Area
<b>Letter</b>	8.5 x 11.0	8.19 x 10.66	216 x 279	208 x 271
<b>Legal Large</b>	8.5 x 14.0	8.19 x 13.69	216 x 356	208 x 348
<b>A4</b>	8.3 x 11.7	7.95 x 11.37	210 x 297	202 x 289
<b>Quarto</b>	8.0 x 10.0	7.67 x 9.68	203 x 254	195 x 246
<b>Commercial</b>	8.3 x 10.6	7.95 x 10.31	210 x 270	202 x 262
<b>Foolscap</b>	8.0 x 13.0	7.67 x 12.67	203 x 330	195 x 322

Paper Type	Inches		Millimeters	
	Page Size	Imageable Area	Page Size	Imageable Area
<b>Folio</b>	8.3 x 13.0	7.95 x 12.67	210 x 330	202 x 322
<b>Legal Small</b>	8.5 x 13.0	8.19 x 12.67	216 x 330	208 x 322

- » *Note: If a requested paper size is not installed in the printer, you are prompted to install the correct paper.*

# Consumables

## Toner

Mono-component toner.

The toner is not classified as hazardous waste under the present EPA regulations. Place in a plastic bag or other sealed container to prevent dust and dispose of by burial in a sanitary landfill or incineration in accordance with any applicable federal, state, and local regulations.

- In case of spills, remove with vacuum cleaner or cold water and soap. Do not use warm water.
- In case of ingestion, rinse mouth with water. If large quantity is ingested, seek medical advice.
- In case of inhalation, clean mouth, nose, and throat; cough up.
- If you get toner on your skin, wash with cold water and soap.
- If you get toner in your eyes, rinse with large quantity of cold water.

## Master Belt

Zinc oxide photoconductive belt for laser printers.

To our knowledge, this master belt presents no health hazards in normal use. Material is not classified as hazardous waste under the present EPA regulations. Dispose of it in accordance with any applicable federal, state, and local regulations.

# Manual Notices

---

# Manual Notice

QMS, Inc. reserves the right to make changes to this manual and to the equipment described herein without notice. Considerable effort has been made to ensure that this manual is free of inaccuracies and omissions. **However, QMS, Inc. makes no warranty of any kind including, but not limited to, any implied warranties of merchantability and fitness for a particular purpose with regard to this manual.** QMS, Inc. assumes no responsibility for, or liability for, errors contained in this manual or for incidental, special, or consequential damages arising out of the furnishing of this manual, or the use of this manual in operating the equipment, or in connection with the performance of the equipment when so operated.

## FCC Compliance

This equipment has been tested and found to comply with the limits for a **Class A** digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

» *Note: To comply with Part 15 of FCC Rules, shielded interface cables must be used.*

---

⚠ **Caution:** *Any modifications or changes to this product not expressly approved by the manufacturer responsible for compliance to Federal Regulations could void the user's authority to operate this product within the Laws and Regulations of the Federal Communications Commission.*

---

---

**⚠️ WARNING!** To prevent electrical shock, do not remove any covers from your printer unless you are experienced in working with circuit boards and are following instructions for procedures described in QMS documentation.

**ACHTUNG!** Um elektrische Kurzschlüsse zu vermeiden, entfernen Sie keine Gehäuseteile von Ihrem Drucker, wenn Sie keine Erfahrungen im Umgang mit elektrischen Bauteilen haben. Befolgen Sie die in der QMS Dokumentation beschriebenen Hinweise.

---

## Laser Safety

This printer is certified as a Class 3B laser product under the US Department of Health and Human Services (DHHS) Radiation Performance Standard according to the Radiation Control for Health and Safety Act of 1968. This means that the printer does not produce hazardous laser radiation.

Since radiation emitted inside the printer is completely confined within protective housings and external covers, the laser beam cannot escape from the machine during any phase of user operation.

## International Notices

### Canadian Users

This digital apparatus does not exceed the Class A limits for radio noise emissions from digital apparatus set out in the Radio Interference Regulations of the Canadian Department of Communications.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques (de la classe A) prescrites dans le Règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

## Vfg 1046/1984 Conformity Statement

Hierdurch bescheinigen wir, daß dieses Produkt in Übereinstimmung mit Postordnung 1046/1984 ist und RFI unterdrückt ist. Die Geschäftslage und der Verkauf diese Geräte auszuprobieren, mit der Übereinstimmung und der Regierung zu bestätigen, wurde der Deutschen Bundespost gegeben.

## Bescheinigung des Herstellers/Importeurs

Hiermit wird bescheinigt, daß QMS 4525 Print System in Übereinstimmung mit den Bestimmungen der Vfg 1046/1984 funktentstört ist. Der Deutschen Bundespost wurde das Inverkehrbringen dieses Gerätes angezeigt und die Berechtigung zur Überprüfung der Serie auf Einhaltung der Bestimmungen eingeräumt.

QMS, Inc., Mobile, AL, USA

## Declaration of Manufacturer/Importer

We hereby certify that the QMS 4525 Print System is in compliance with Vfg 1046/1984 and is RFI suppressed.

The marketing and sale of this equipment was reported to the German Postal Service.

The right to retest this equipment to verify compliance with the regulation was given to the German Postal Service.

QMS, Inc., Mobile, AL, USA

## Electronics Emissions

Your printer complies with the Electronics Emissions Requirements of the German Federal Minister for Postal and Telecommunication Technology regulation

Vfg 1046/1984

Your printer complies with the Electronics Emissions Requirements of the European Economic Council directive.

82/499/EEC

## Colophon

This manual was written and formatted in FrameMaker. Some illustrations were created in Adobe Illustrator and translated to WMF format using Transverter Pro, other illustrations were created directly in FrameMaker. Typefaces chosen are Benguiat, Courier, Helvetica, MarkerFelt, and Tekton. The manual was printed in camera-ready form on a QMS printer.
